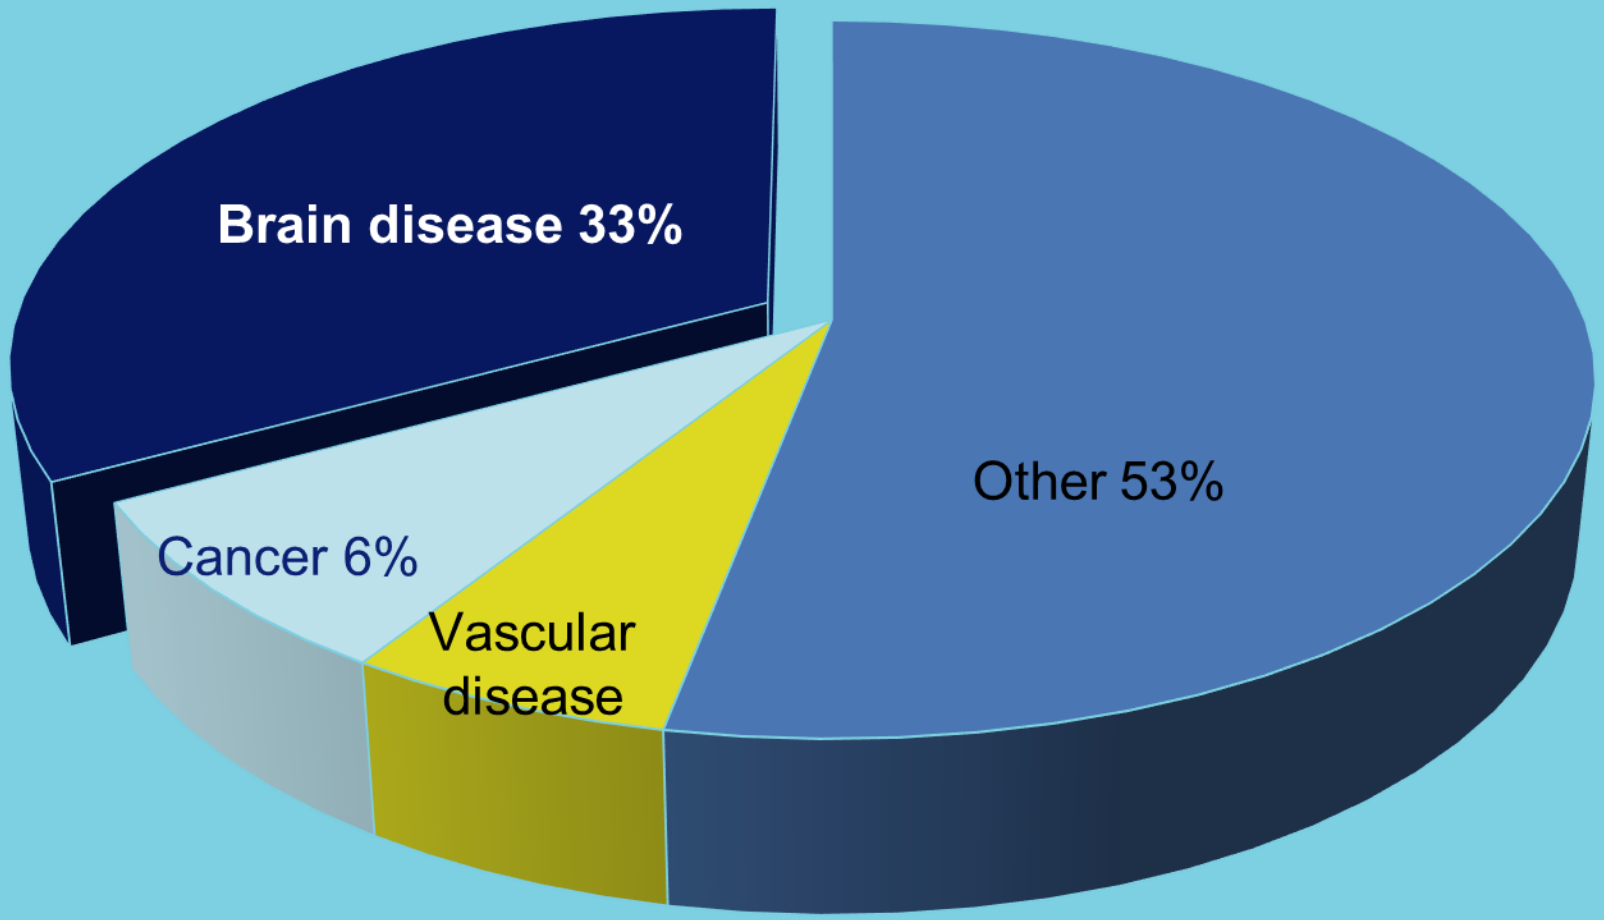
ABNORMAL DEVELOPMENT

RED FLAGS AND CLUES TO DIAGNOSIS

Coriene Catsman-Berrevoets

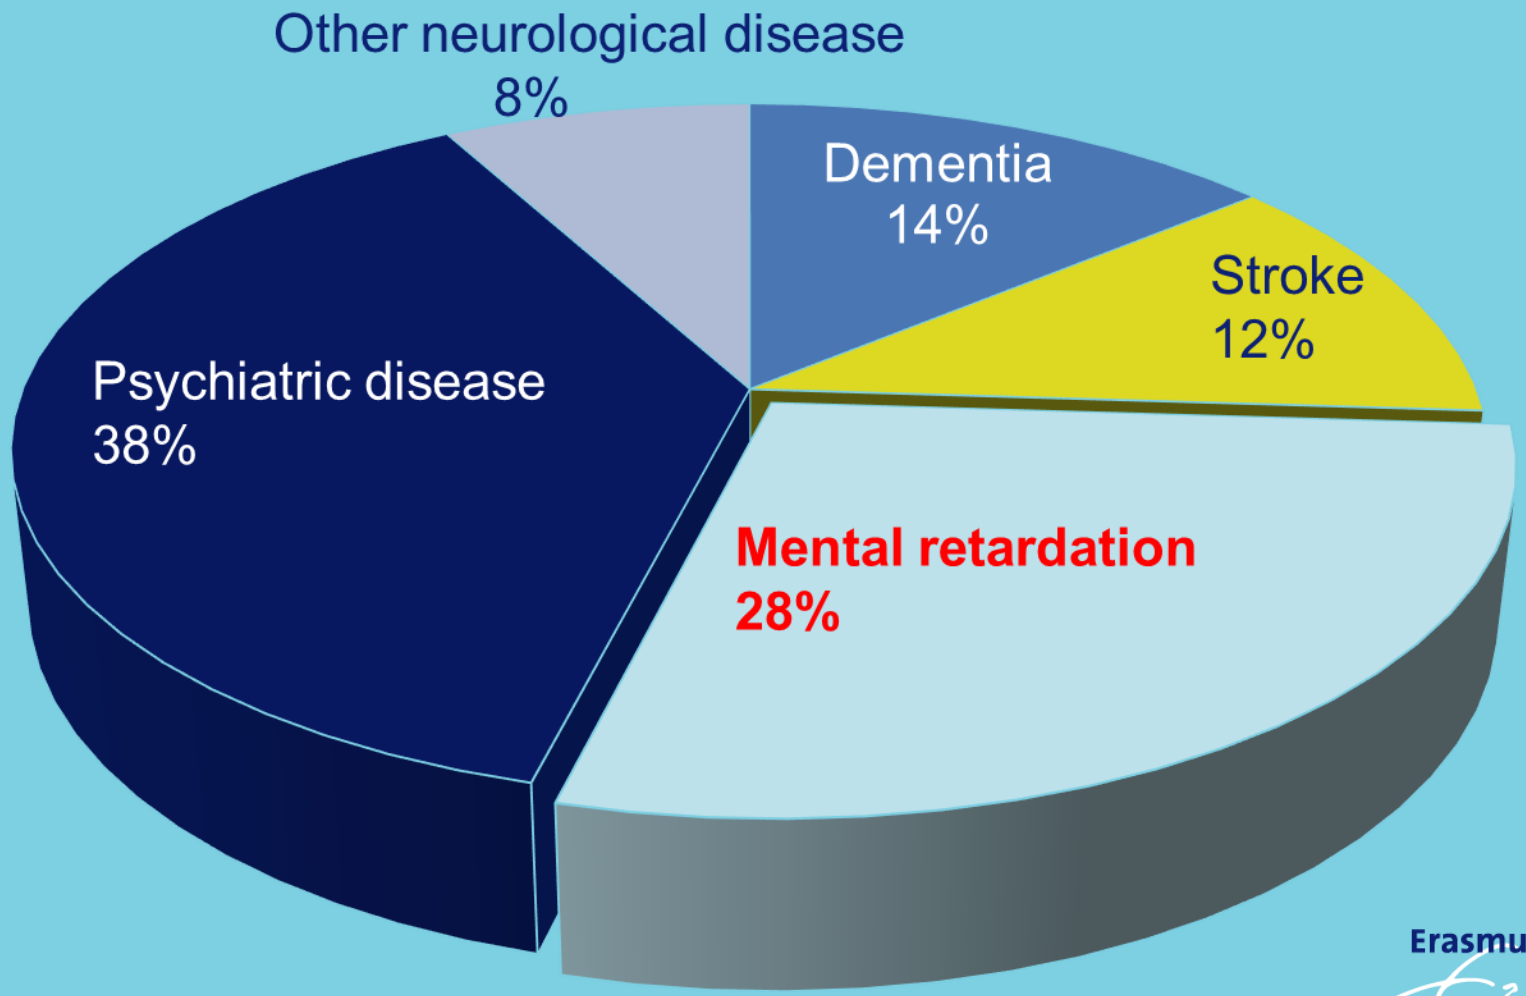
c.catsman@erasmusmc.nl

Financial burden to society



Erasmus MC

Costs to society of brain disease



Erasmus MC

How to analyse a child with a developmental disorder

- Patient history: parents, social circumstances, daycare, school etc
- Physical examination
- Neurological examination

Use all your senses and basic tools to create a sensibel differential diagnosis

Than choose the most helpful technical evaluations

Important questions in patient history

- When was the developmental delay firts noticed?
- Slow development? No further development? Regression?
- Which aspects do not develop: mainly motor problem, language, behaviour?
- Family history? Relatives with similar problems? Consanguinity?
- Detailed history:

  Pregnancy, perinatal problems, developmental milestones, cerebral trauma, epilepsy,….

Erasmus MC

Important is information on

-
  - ← visual, auditory sensory disturbances
  - ←Behaviour
  - ← Neglect / abuse
  - ←Intercurrent illness, environmental deprivation / hospitalisation
  - ←Familial occurence of similar developmental problems

Erasmus MC

Focal neurological signs / symptoms

Mixed aphasia

Bradyphrenia

Behavioural disorder

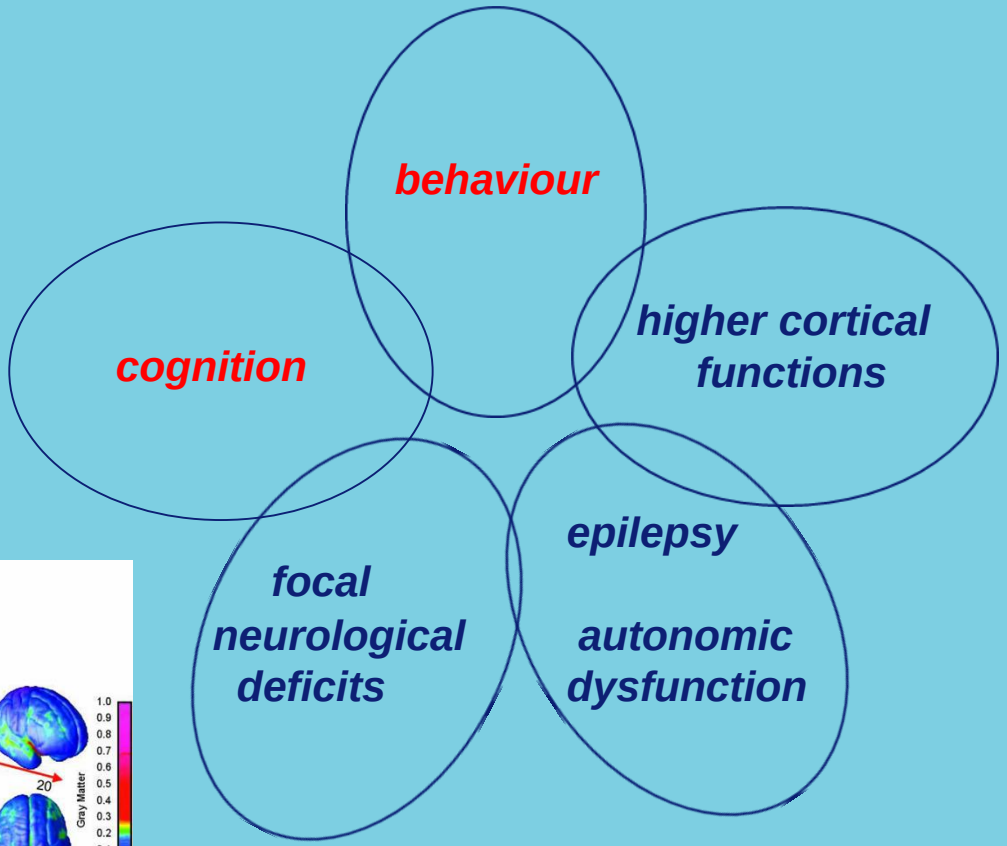
Memory and concentration disorder

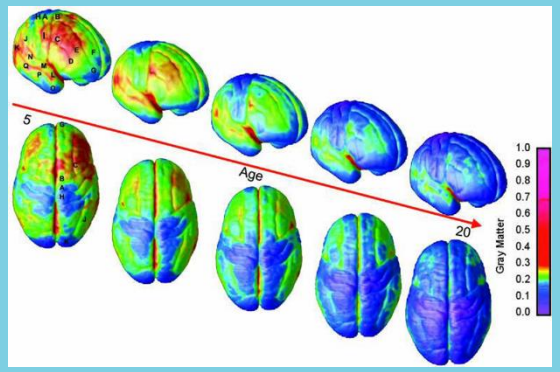
Right piramidal paresis

Erasmus MC

Disabilities after ABI may become apparent later in life through growing into deficit

- 50% of survivors of moderate-severe TBI have an unfavourable outcome
-

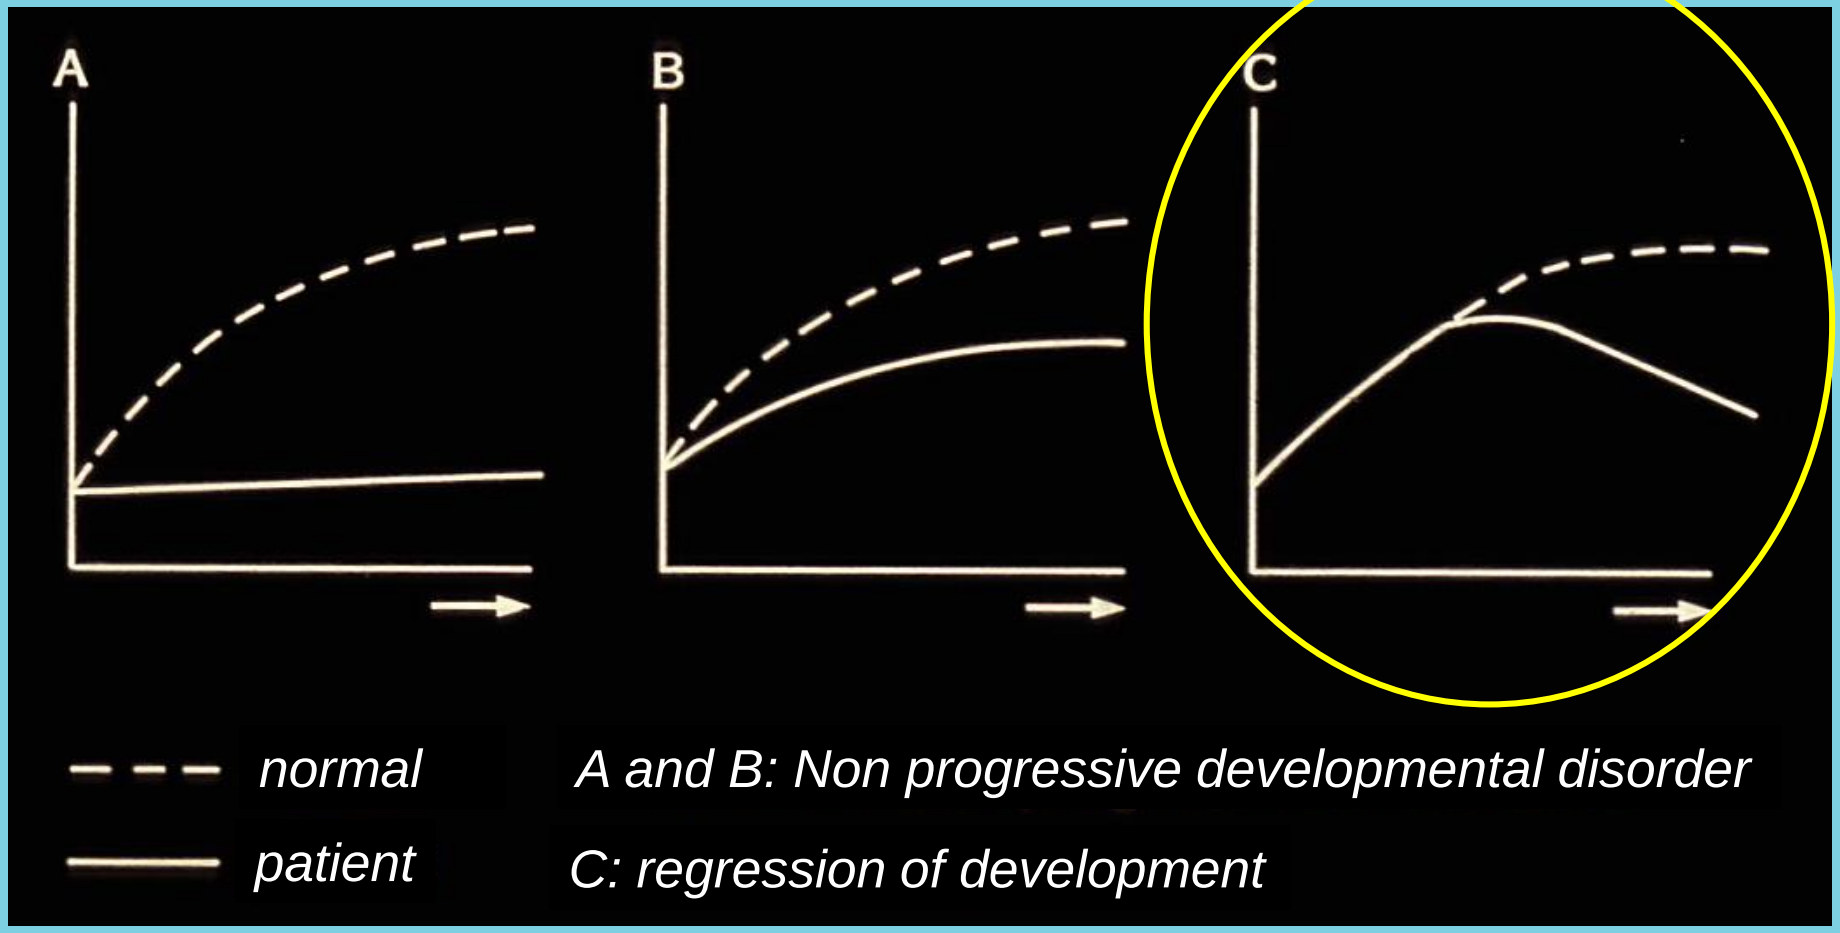




Cogtai et al 2004

Erasmus MC

Decide the type of the developmental disorder



Erasmus MC

Regression of development without obvious event

- **Common disorders**
- (Affective) abuse / neglect/
- Chronic illness (hospitalisation)
- Hypothyreoidie
- Intoxications (Pb)
- Deficiencies
- (low grade) brain tumour
- Chronic infections

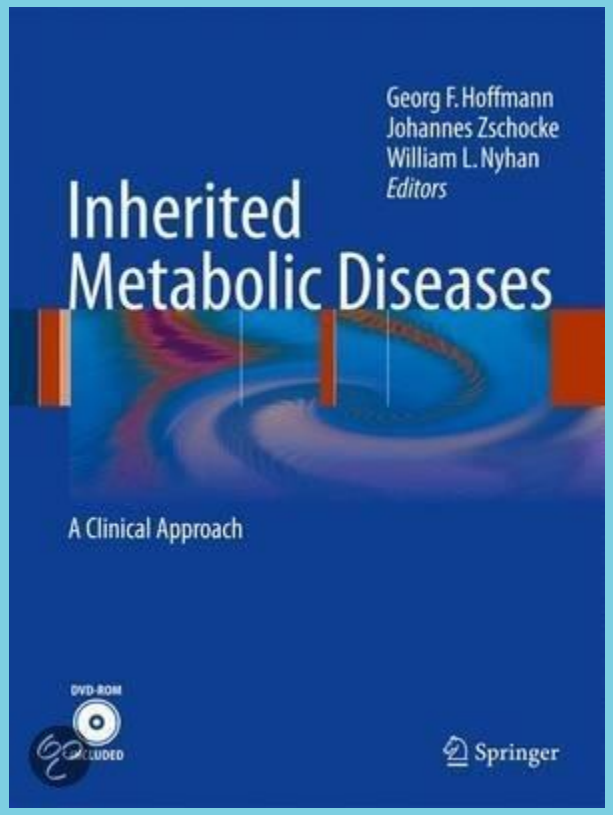
- **Large group of rare diseases**

Erasmus MC

Rare diseases are a common cause of developental regression

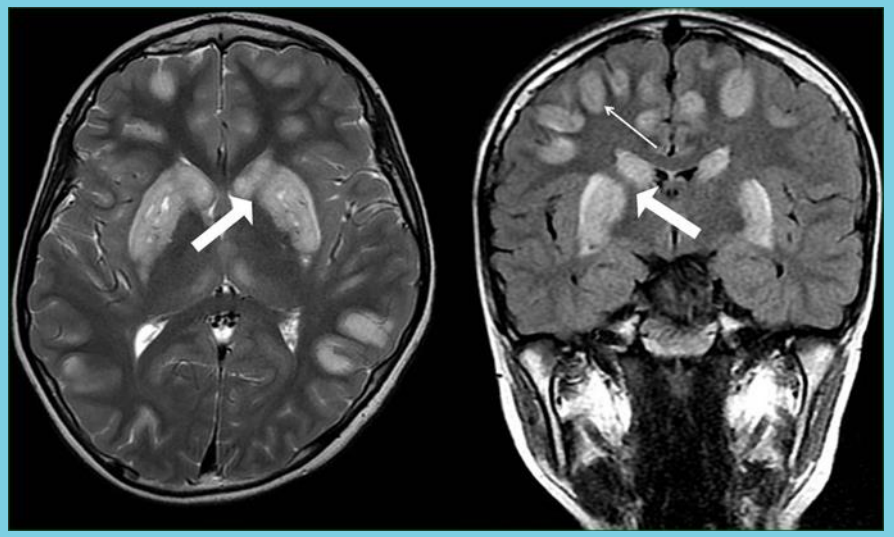
- Metabolic diseases
  - Aminoacidopathies
  - Lysosomal diseases
  - Mitochondrial disease
  - Peroxisomal disease
  - Congenital defects of glycosylation (CDG)

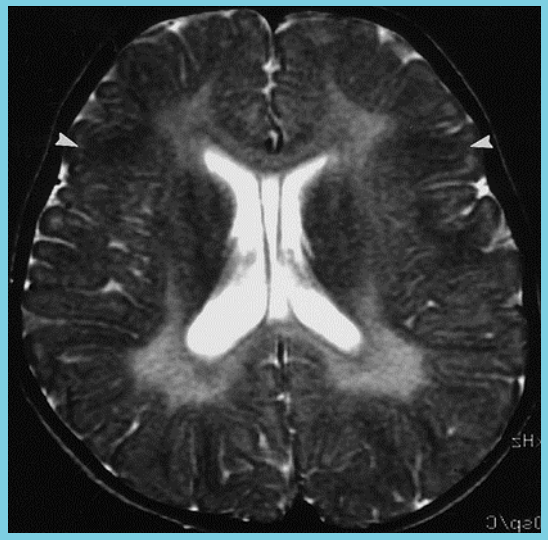
- Many others
  - Rett syndrome
  - Limbic encefalitis
  - Infantile neuroaxonale dystrofy and related diseases
  - Etc ……..

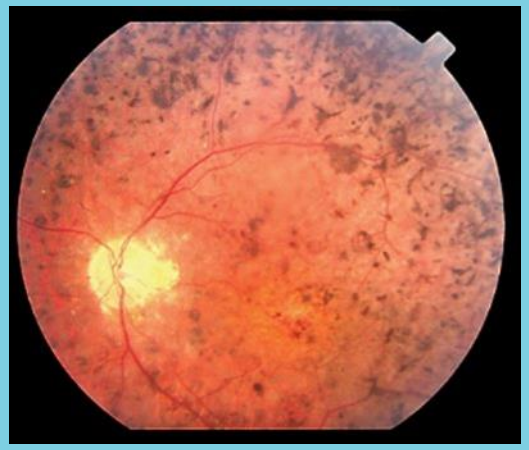


Erasmus MC

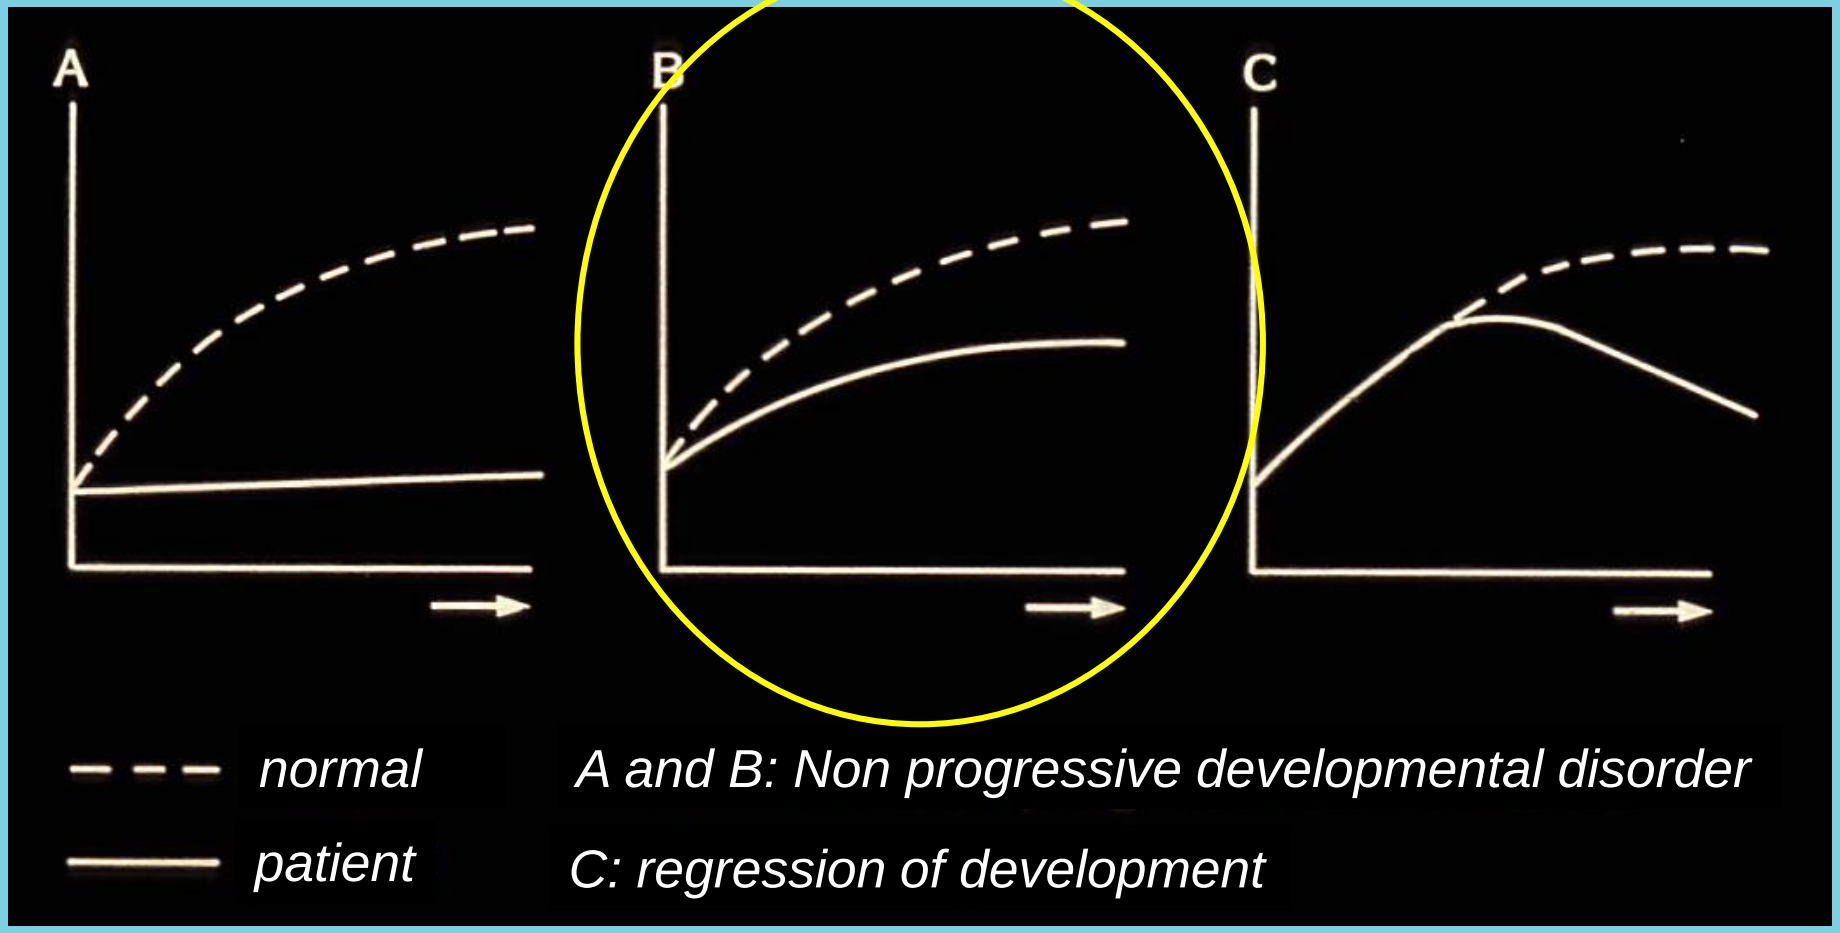
Analysis may be complicated and time consuming







Decide the type of the developmental disorder



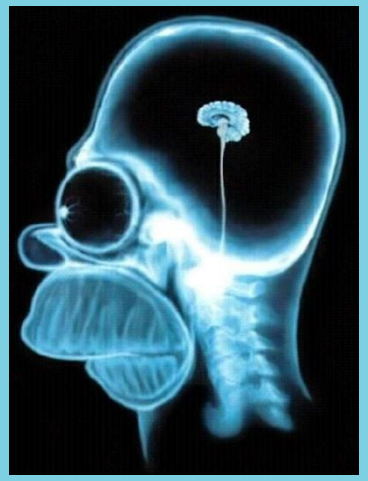
Erasmus MC

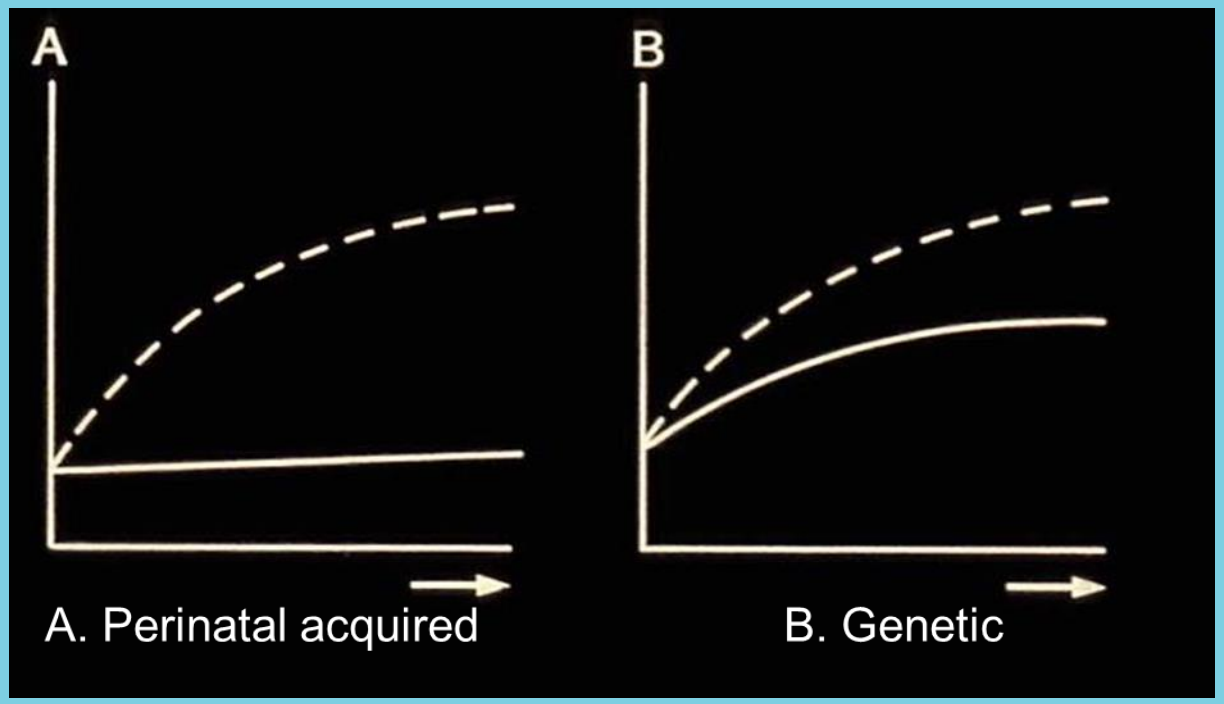
The red flags at first sight in children with developmental problems

- ← Skull circumference and shape
- ←Skin abnormalities
- ← locomotion
- ←Behaviour
- ←Dysmorfic features

Definition Microcephaly

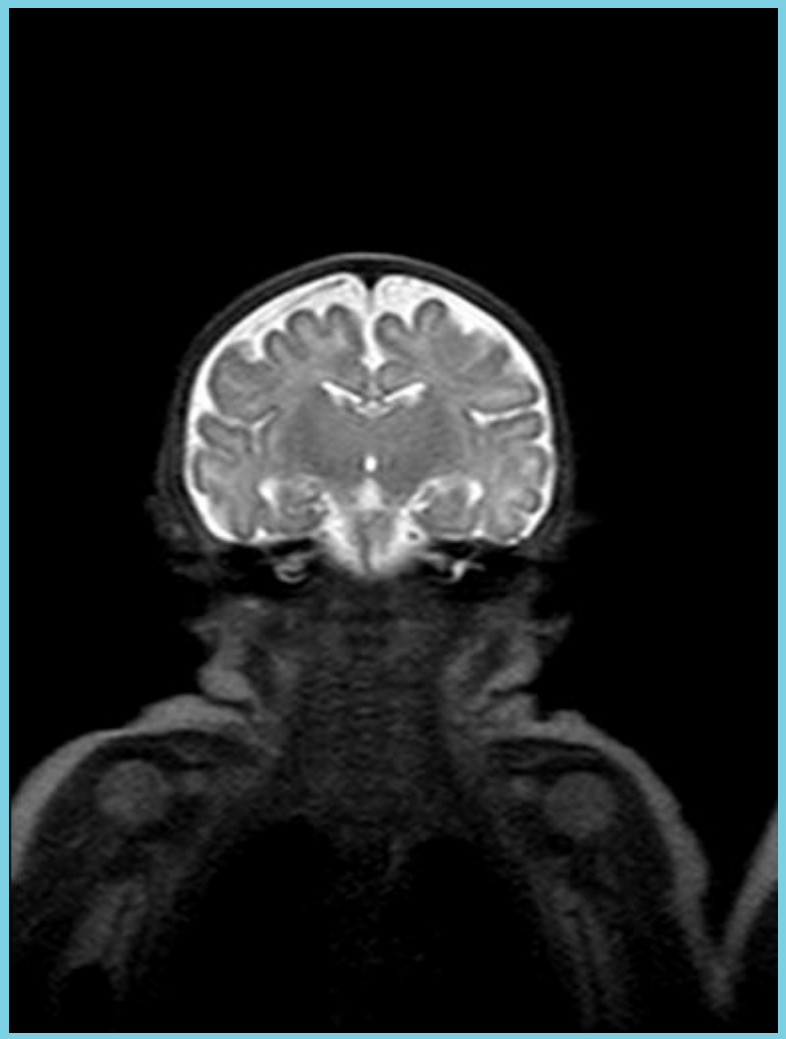
- Occipital-frontal circumference < -3 sd
  - Corrected for age, gender, gestation

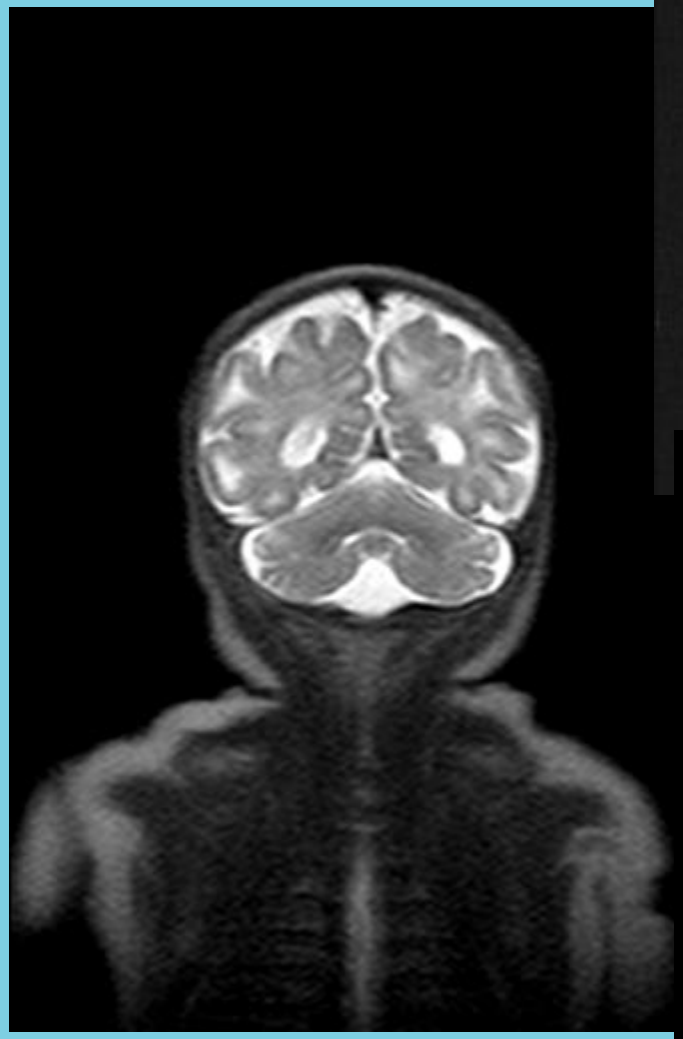


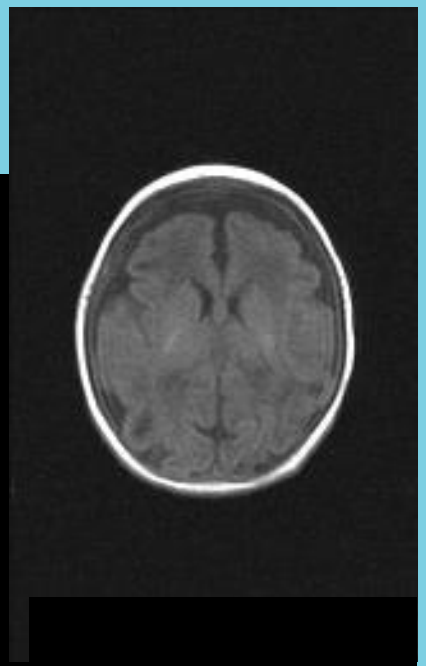


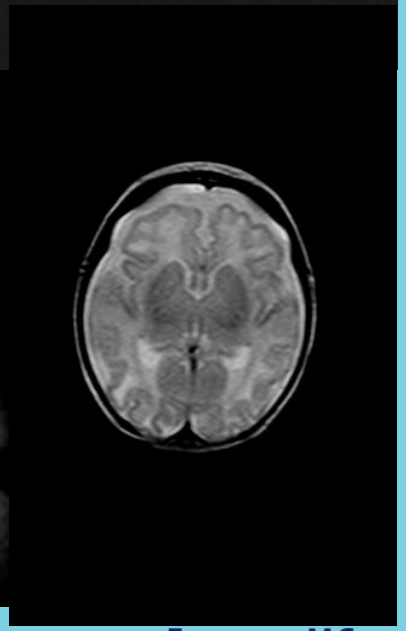
Growth pattern of different types of microcephaly

Describe what you see









Simplified gyral pattern

Erasmus MC

Classification microcephaly

- Primary
  - Develops before 32th week of gestation
- Secondary
  - acquired

Etiological overlap between primary and secondary microcephaly

- Syndromal / genetic
- Metabolic disorder
- Environmental factors
- Infections

Erasmus MC

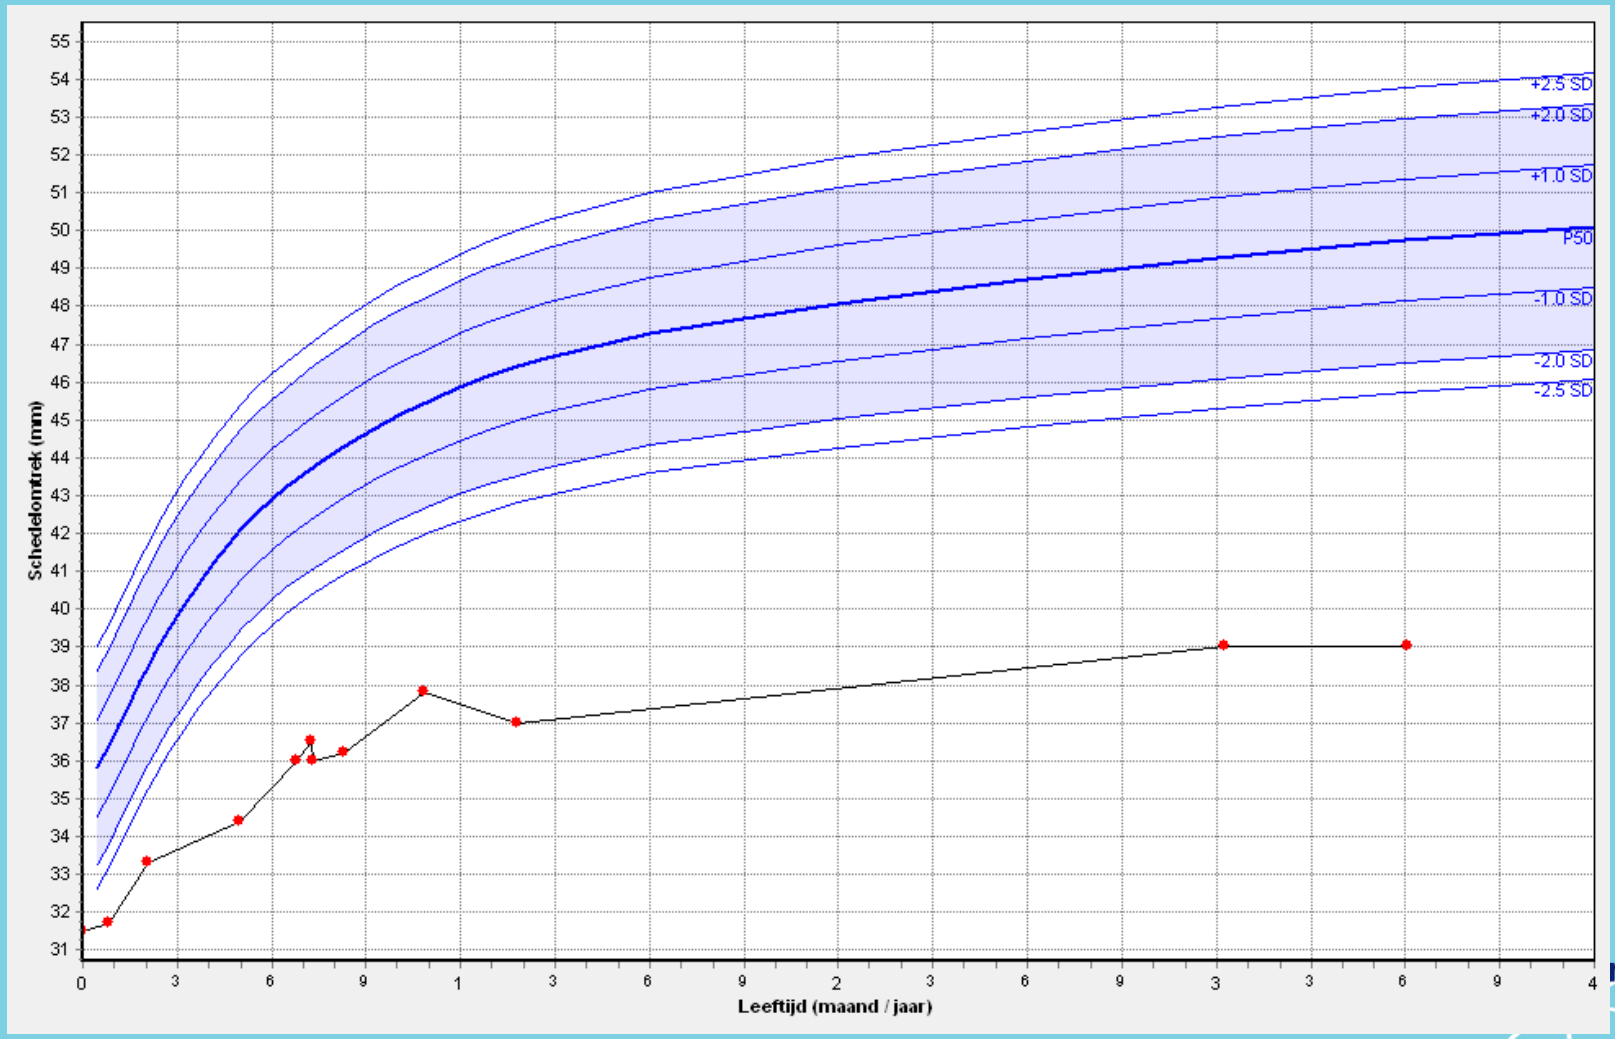
Aetiology

acquired/ secondary micocephaly

- Traumatic
  - Infarction /hemorrhage
  - **(twin to twin transfusion)**
- Congenital Infection
  - TORCHES: Toxoplasma, Rubella, CMV, HSV, Syphilus: Zikka??
- *Deprivation (maternal)*
  - *Hypothyroidy*
  - *Malnutrition*
  - *etc.*
- Teratogenic (maternal)
  - Toxic: fetal alcohol syndrome, smoking, lead, pesticides, etc
  - Systemic disease (PKU, diabetes)
  - Medication (for example antiepileptic drugs)

Erasmus MC

Diagnosis: Early Infantile Epileptic Encephalopathy type 10 (*PNKP-gen)*



Another example: Marilotte 2 ½ years old

- Developmental delay, SC < -3
  - Can crawl, sits unsteady, pulls to to standing
  - Does not speak, only grumbles
  - Situative understanding
  - Salivates a lot
  - Happy child, laughs a lot
  - Hyper-motoric behavior, waves with her hands
  - Loves playing with water

Erasmus MC

Marilotte 2 ½ years old

- Ophtalmologist: no abnormalities .
- MRI brain: normal
- array: deletion chromosome 15:
- Angelman syndrom or PWS ?
- DNA : Angelman syndrome

http://www.youtube.com/watch?v=bzVZ8QLQH2w

Erasmus MC

DIAGNOSTIC CRITERIA (2005)

- ***A. Consistent features (100%)***
  - 1. **Developmental delay, functionally severe**.(IQ 20-30)
  - 2. **Movement or balance disorder**, usually ataxia of gait, and**/**or tremulous movement of the limbs. Movement disorder can be mild. May not seem as frank ataxia but can be forward lurching, unsteadiness, clumsiness, or quick, jerky motions.
  - 3. **Behavioural uniqueness**: any combination of frequent laughter**/**smiling; apparent happy demeanor; easily excitable personality, often with uplifted hand-flapping movements, or waving movements; hypermotoric behaviour.
  - 4. **Speech impairment**, none or minimal use of words; receptive and non-verbal communication skills higher than verbal ones.
- ***B. Frequent features (more than 80%)***
  - 1. **Delayed, disproportionate growth in head circumference**, usually resulting in microcephaly (<_2 SD of normal OFC) by age 2 years. Microcephaly is more pronounced in those with 15q11.2-q13 deletions.
  - 2. **Seizures**, onset usually <3 years of age. Seizure severity usually decreases with age but the seizure disorder lasts throughout adulthood.
  - 3. **Abnormal EEG**, with a characteristic pattern of large amplitude slow-spike waves. The EEG abnormalities can occur in the first 2 years of life and can precede clinical features, and are often not correlated to clinical seizure events.

Dysmorfic features

- Light skinned, blond hair
- Facial features become more prominent in time
- brachy-microcephaly
- broad face, narrow mid-face
- broad mouth, wide spaces between teeth
- Pointed chin, later mandibulare prognathy
- Tongue protrusion

Erasmus MC

Dysmorphic features in Angelman syndrome become more evident later in life

Van Buggenhout et al, Eur J Hum Genet 2009;17:1367-1373

Erasmus MC

Epilepsy in Angelman syndrom

- 85 % epilepsie
- onset at age 12-18 months
- No specific type of epilepsy
- May hav very long lastig (weeks) partiel status
- EEG, with a characteristic pattern of large amplitude slow-spike waves
- Often refractory

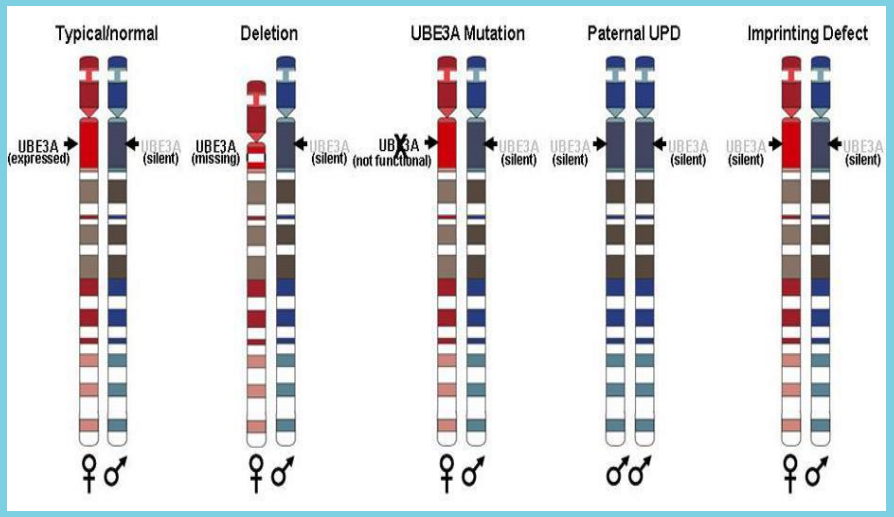
Behavioural characteristics

- hand-flapping (happy puppet)
- social smiling without babbling, later typcal bout of laughter
- Social children
- Hyperactive, impulsive, easily distracted
- Fixations (specific food, water)
- Autistiform behavioural features
- Sterotype movements
- Later rigidity

- http://youtu.be/lpWl2DucZM4

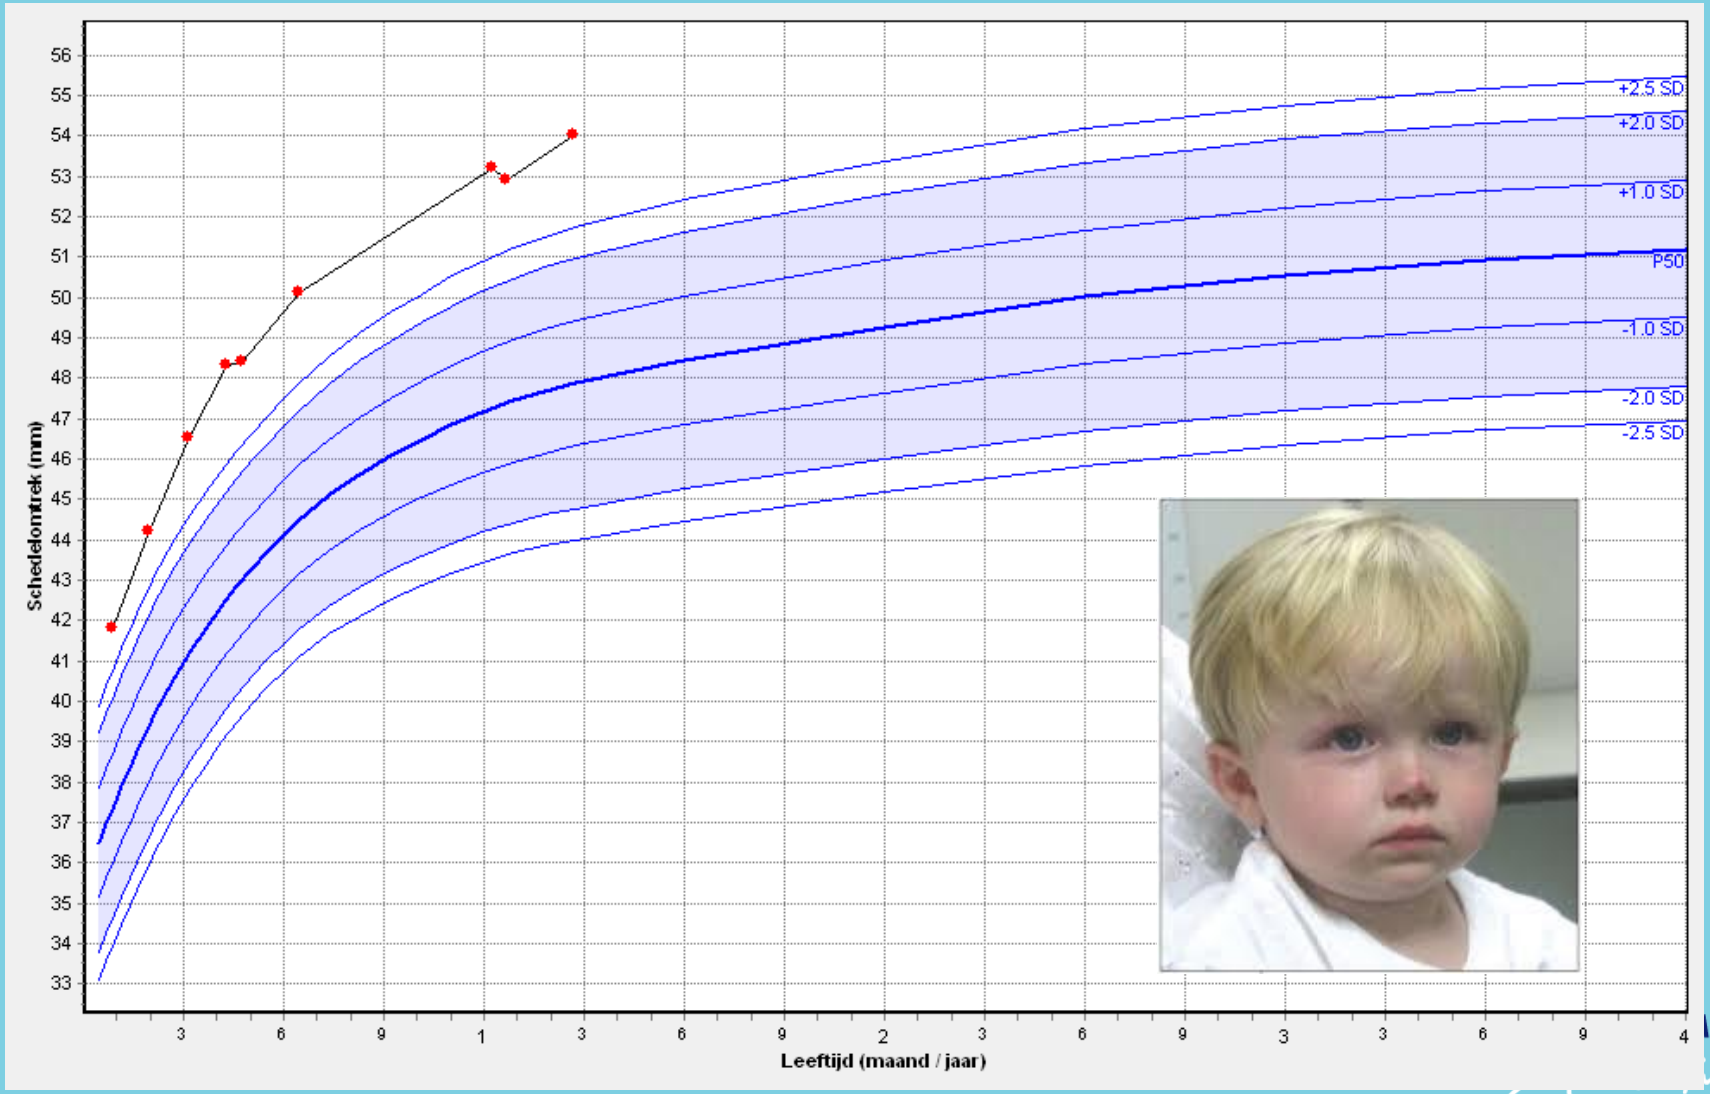
Genetics

- central role UBE3A gene on *maternal* chromosome 15q11-13
- in 90% genetic diagnosis possible
- Almost always de novo mutation
- 4 variants
  - 1. deletion 15q11-13 (70%)
  - unipaternal disomy (3%)
  - imprinting deficit (5%)
  - UBE3A-mutation (20%)



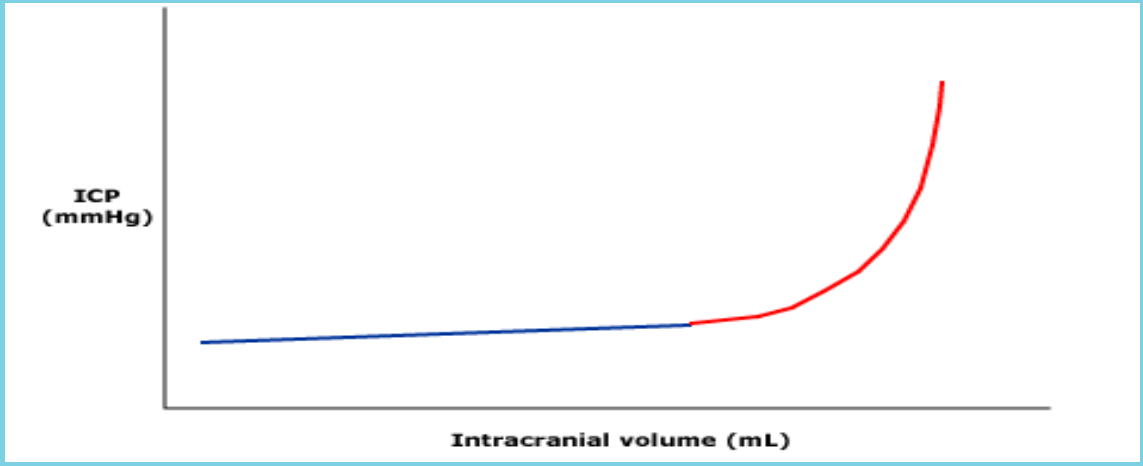
Erasmus MC

Skull circumference >3SD: Macrocephaly



Etiology

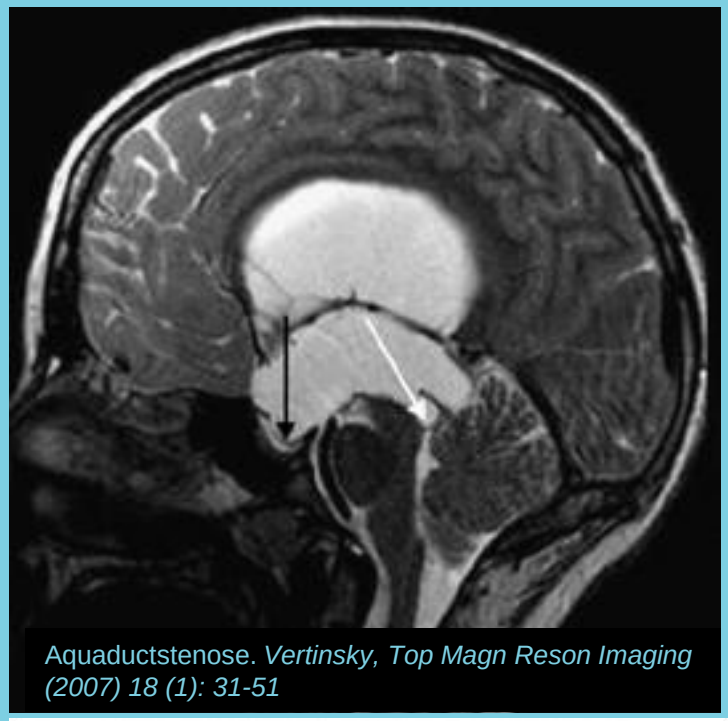
- Abnormal increase of one of the components in the skull :
  - Spinal fluid
  - Blood
  - Bone
  - Brain tissue



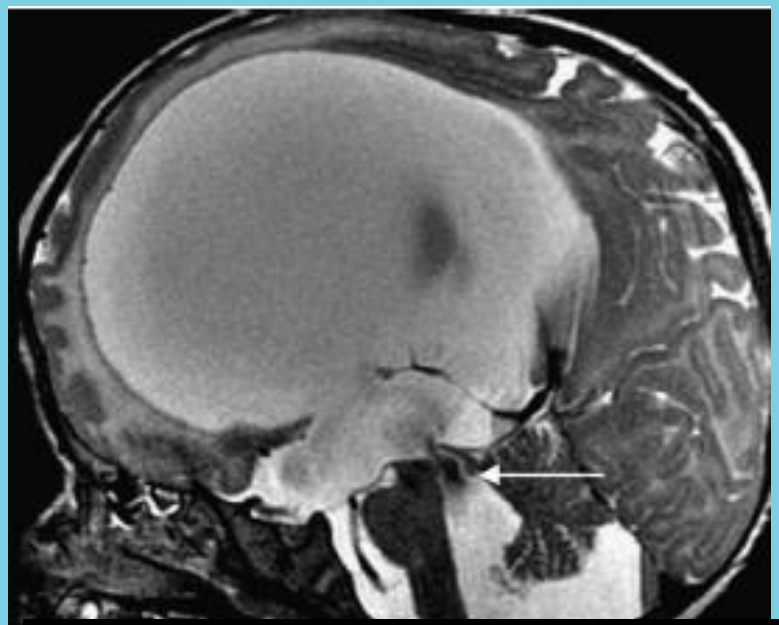
Erasmus MC

Increase spinal fluid volume

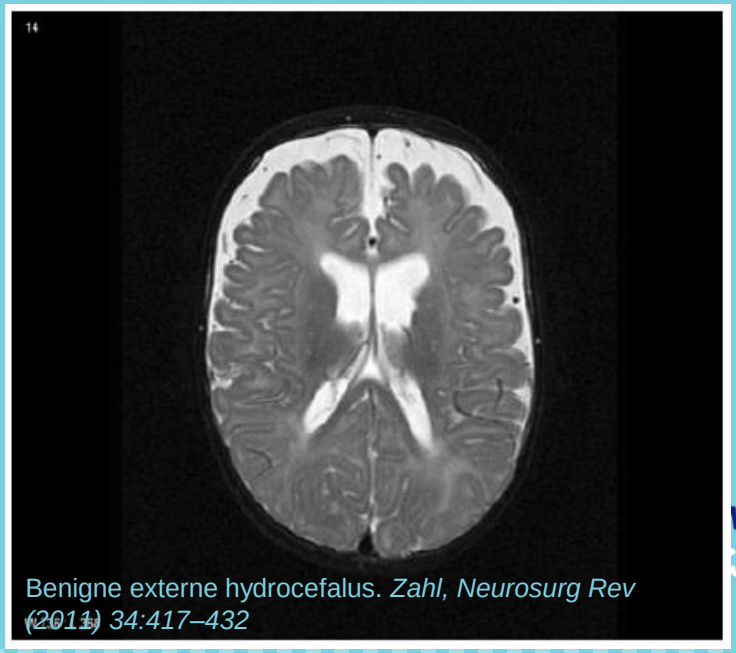
- Communicating hydrocephalus
- Obstructive hydrocephalus
  - Primary
  - Secundary
- Benign external hydrocephalus



Aquaductstenose. *Vertinsky, Top Magn Reson Imaging (2007) 18 (1): 31-51*



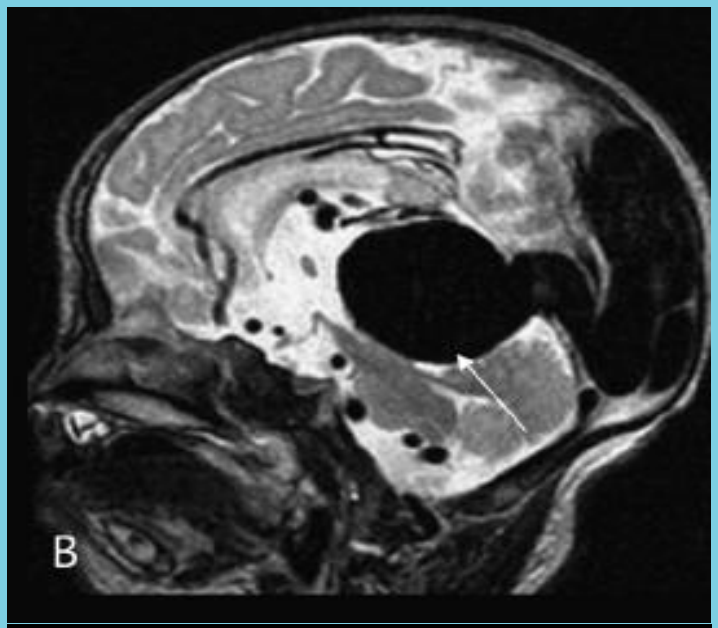
Posthemorrhagische comm hydrocefalus. *Vertinsky, Top Magn Reson Imaging (2007) 18 (1): 31-51*



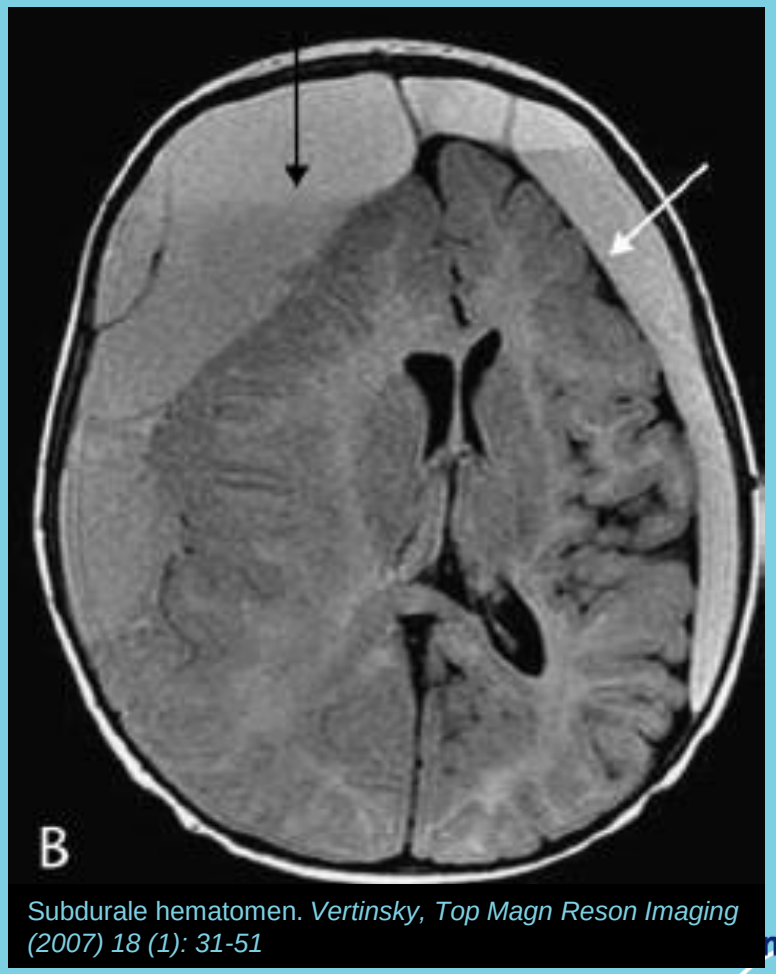
Benigne externe hydrocefalus. *Zahl, Neurosurg Rev (2011) 34:417–432*

Increased volume blood in other compartments

- (Chronic) subdural hematoma
- Hygroma
- Empyema
- Vein of Galen malformation



Vene van Galen malformatie. *Vertinsky, Top Magn Reson Imaging (2007) 18 (1): 31-51*

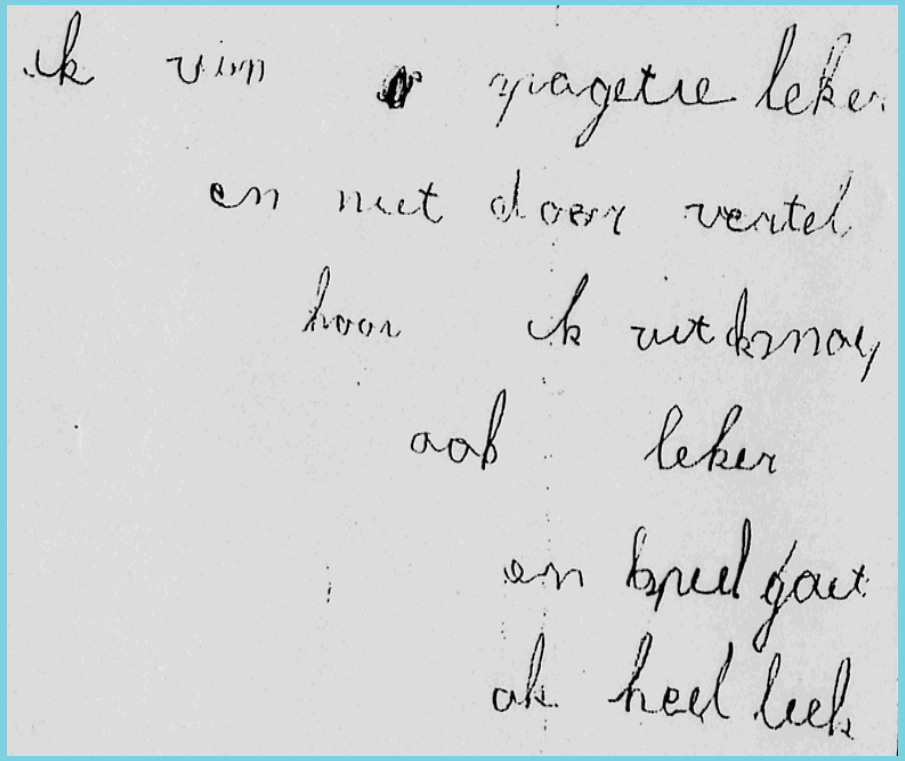


Subdurale hematomen. *Vertinsky, Top Magn Reson Imaging (2007) 18 (1): 31-51*

mus MC

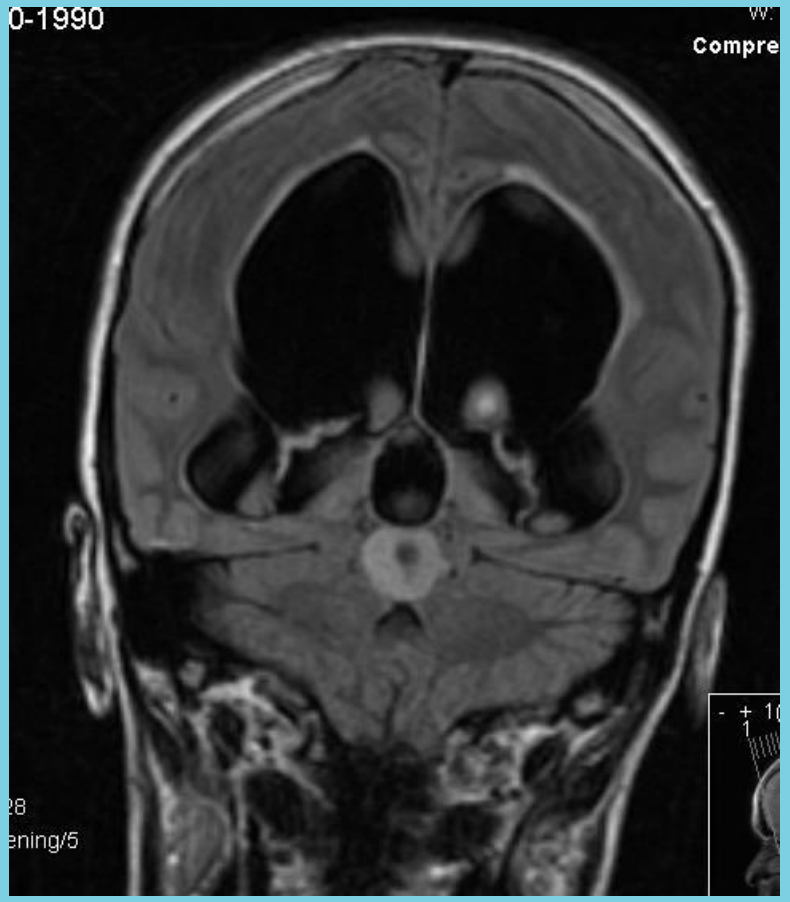
8 years old girl: SC > 3 SD

- School results deteriorated during the past year
- Calculation A → D
- Handwriting is harder to read
- becomes more clumsy
- slow
- no other symptoms/ complaints



8 years old girl: SC > 3 SD

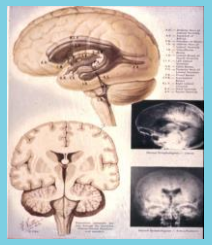
- School results deteriorated during the past year
- Calculation A → D
- Handwriting is harder to read
- becomes more clumsy
- slow
- no other symptoms/ complaints

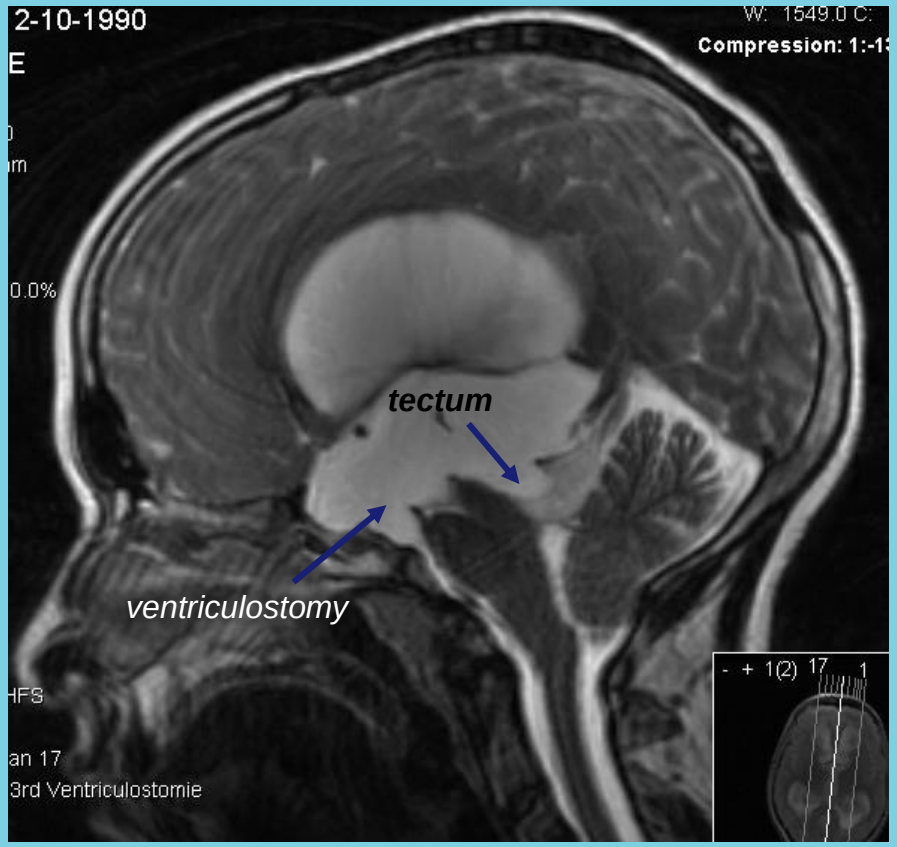


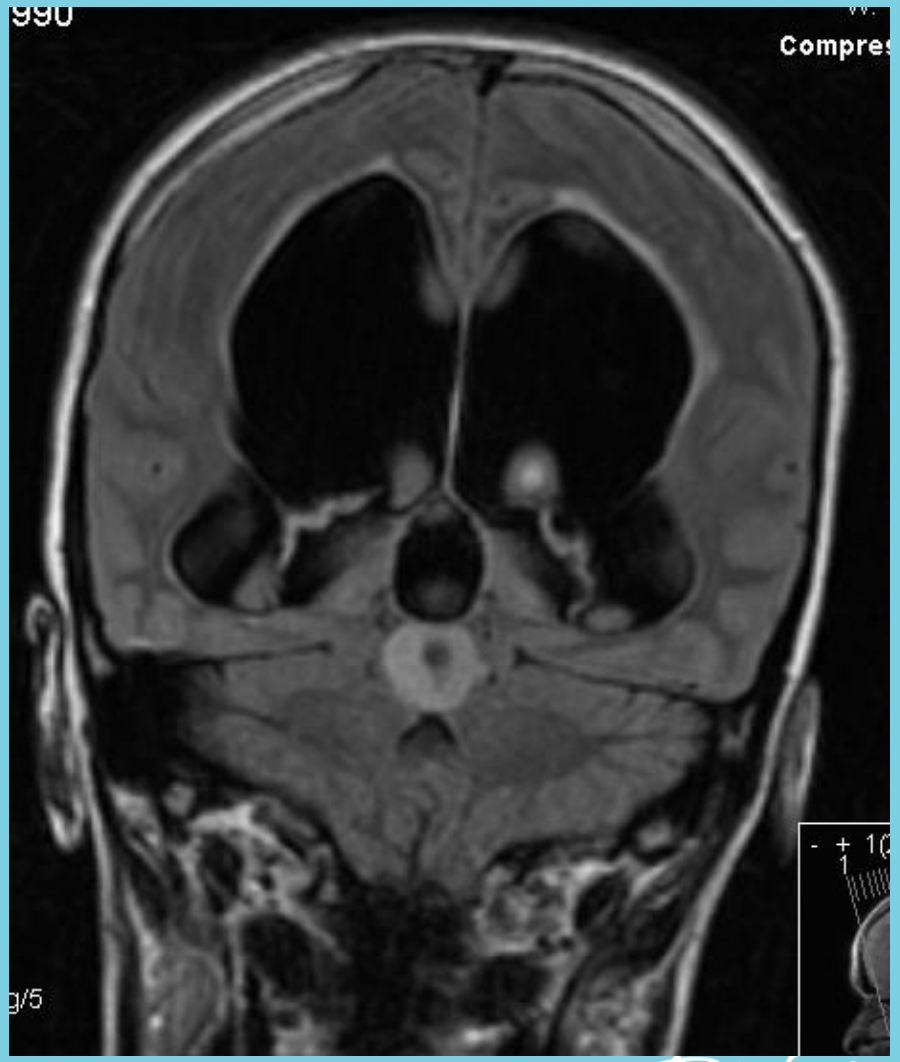
- MRI: obstructive hydrocephalus associated with a small tumor in the mesencephalon

Erasmus MC

Obstructive hydrocephalus in a girl with a tectum glioma

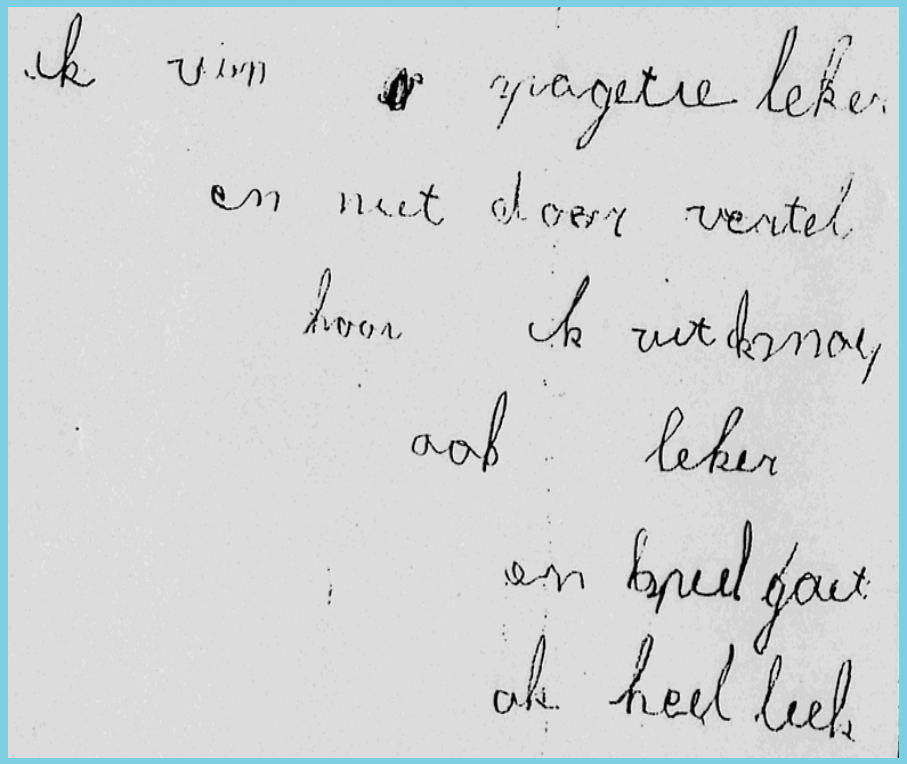




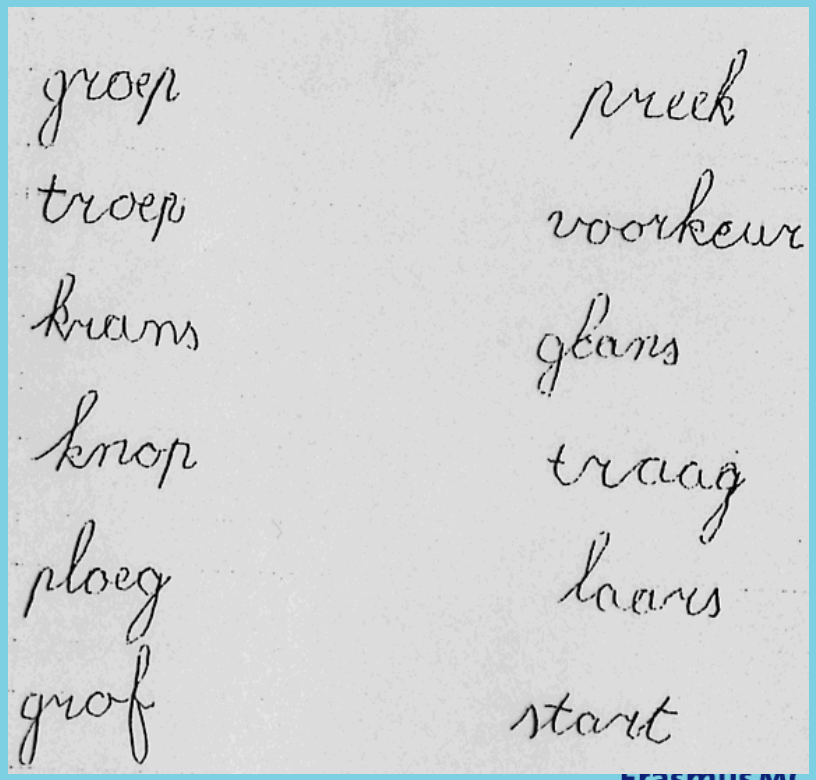


Treatment: ventriculostomy

- Neglect/ inattention before ventriculostomy



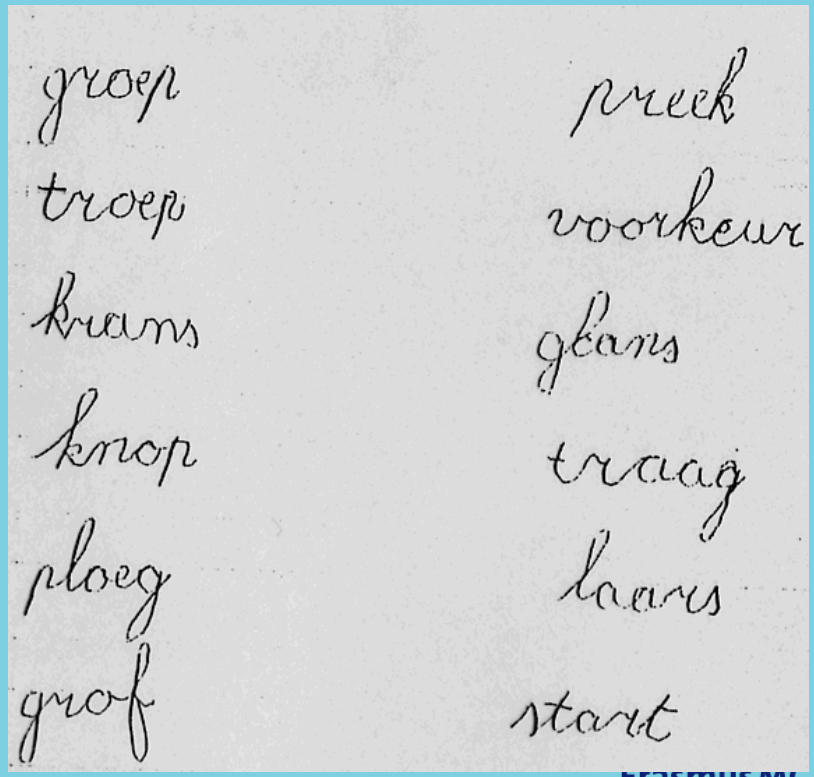
- Neglect/ inattentie after ventriculostomy



Treatment: ventriculostomie (tumor stabiel)

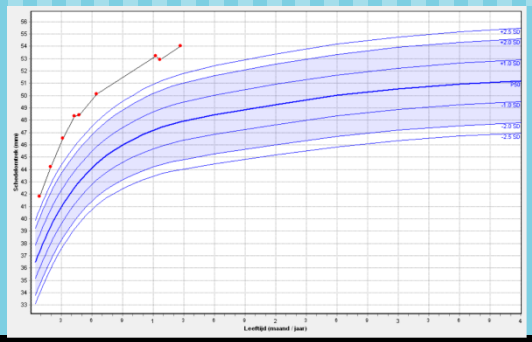
- **Follow up:**
- Finished high school
- Now in college
- No motor problems
- No endocrine problems

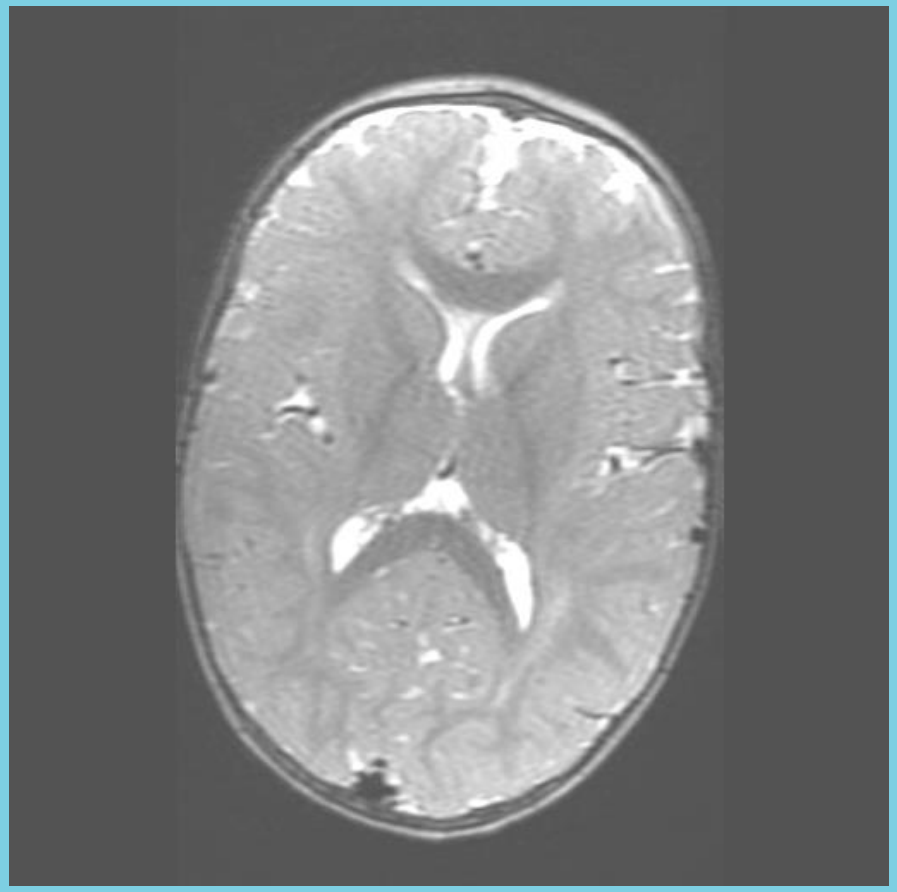
- Neglect/ inattention after ventriculostomy

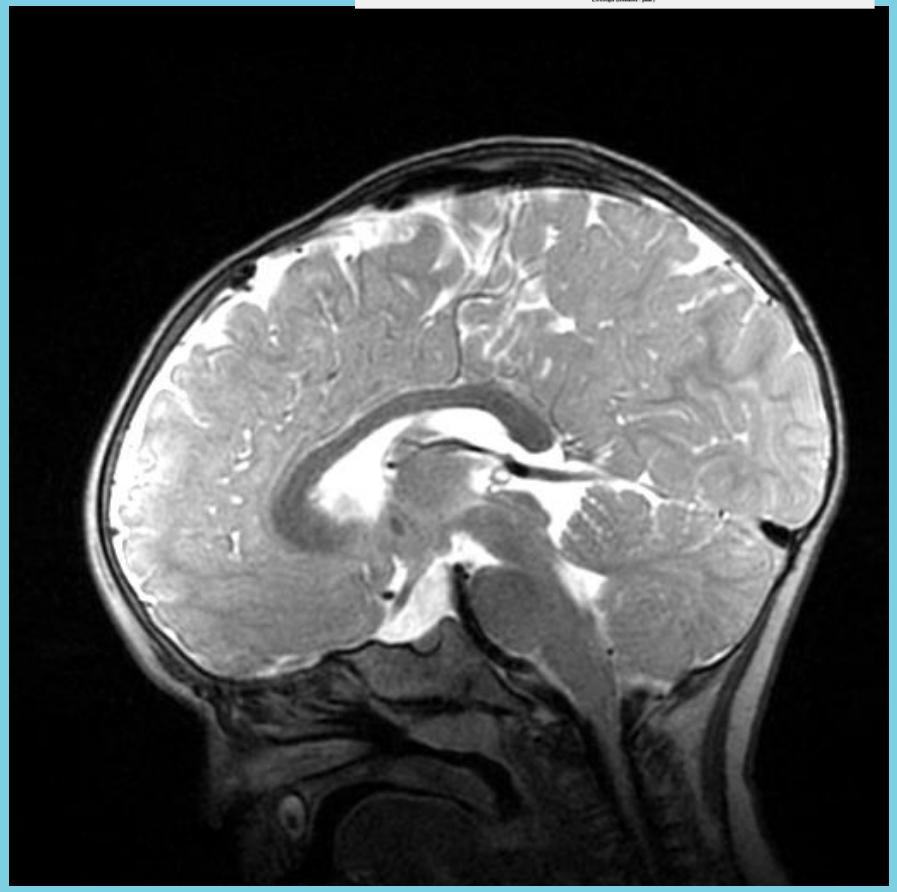


Erasmus MC

Increased growth of brain

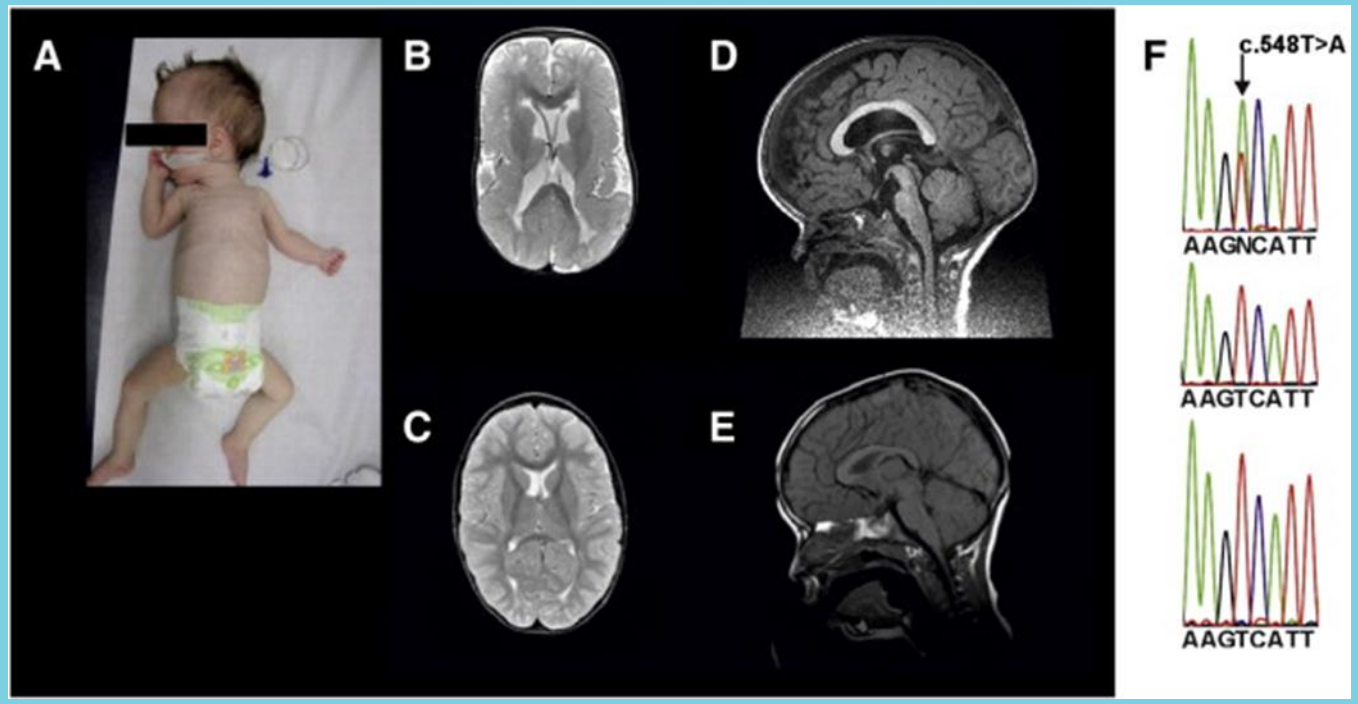






Erasmus MC

AKT 3 mutation: megalencephaly and mental retardation



Nellist et al: Germline activating AKT3 mutation associated with megalencephaly, polymicrogyria, epilepsy and hypoglycemia. Molecular Genetics and Metabolism 114;3: 2015, 467–73

Erasmus MC

Increased growth of brain tissue

- **Metabolic disease**
  - Mucopolysaccharidosis
  - Mucolipidosis

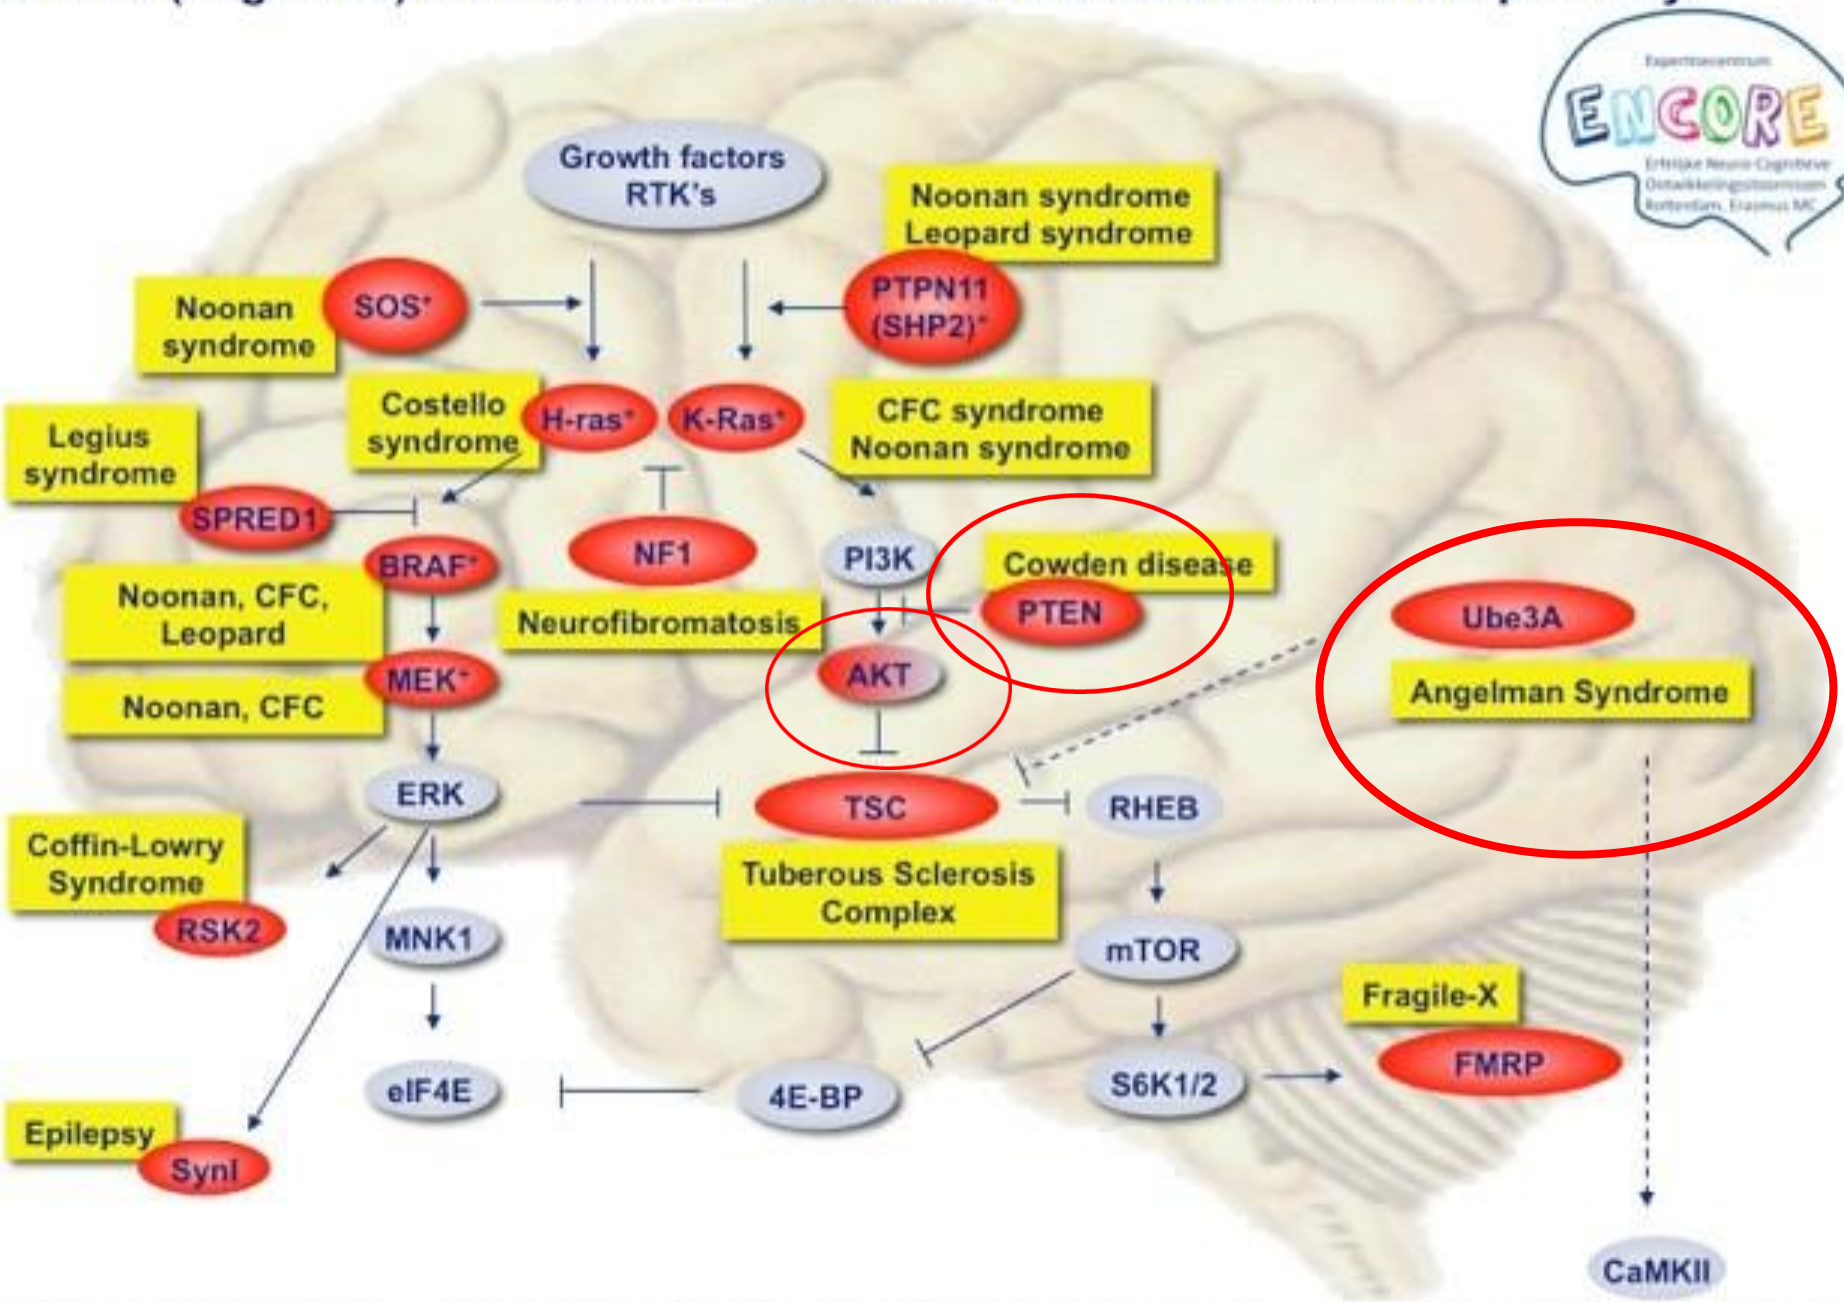
Increased growth of brain tissue

- Normal neurological investigation
  - overgrowth,
  - *PTEN* hamartoma, mental retardation
  - Neurocutaneous syndromes

***Cowden**: Orale papilloma and trichilemmoma*

Erasmus MC

Genetic (cognitive) disorders associated with the RAS/ERK/mTOR pathway



Basal cel naevus syndrome / Gorlin syndrome : chromsome 9q 22-23 –PTCH1 gen

- Learning problems

- Dysmorfisms:

  Macrocephaly, hypertelorism

- Skin
  - Basal cel carcinomas on sun exposed skin
  - Palmar pits op voetzolen en handen
- Skelet deformities
  - Odontogenic cysts of the jaw, spina bifida occulta, kyfoscoliosis, rib abnormalities

Basal cel naevus syndrome / Gorlin syndrome : chromosome 9q 22-23 –PTCH1 gen

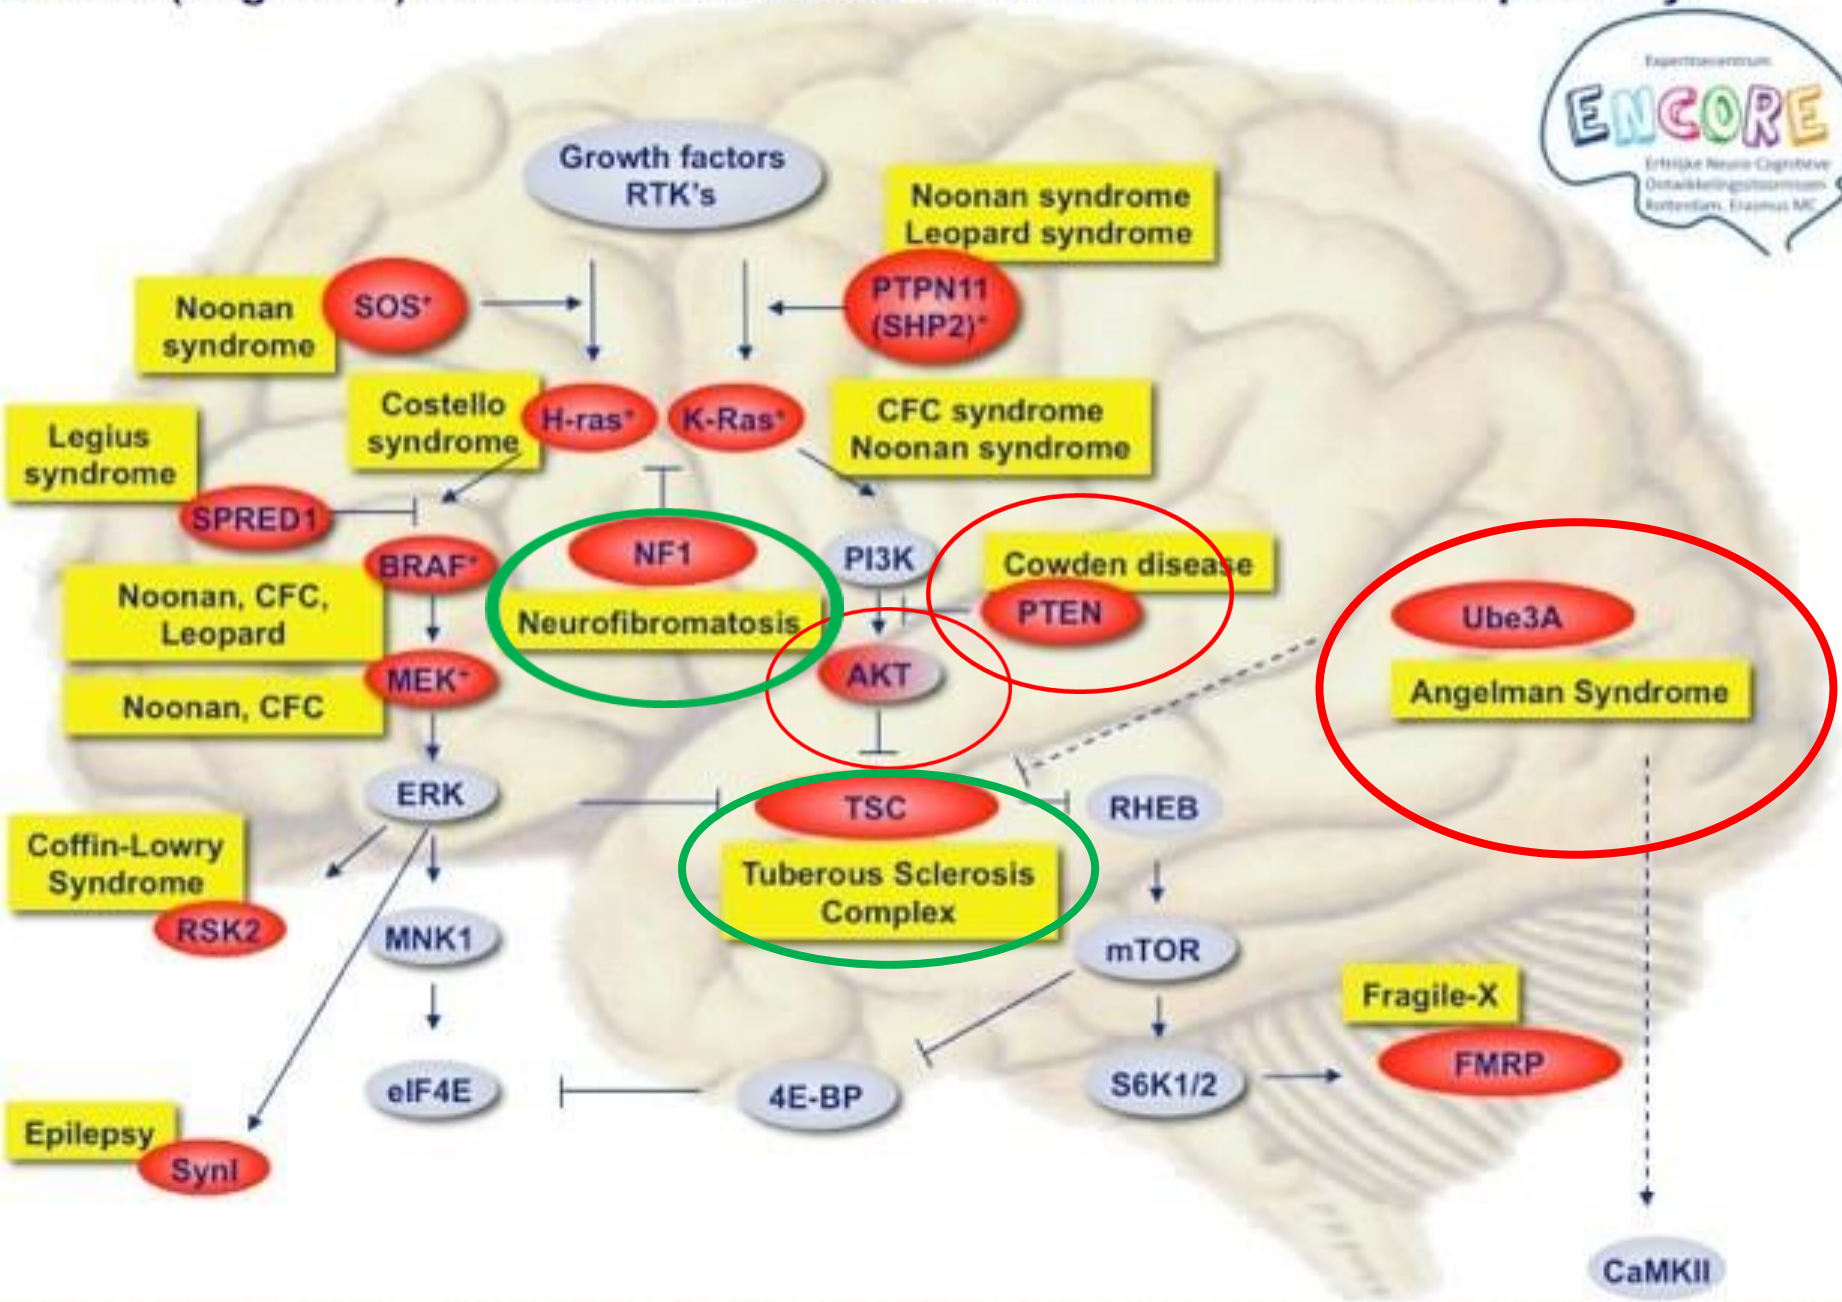
- **CNS**
  - Hydrocephalus.
  - Agenesis Corpus Callosum
  - Medulloblastoma (5%)

Erasmus MC

Macrocephaly AND skin abnormalities in children with a developmental and behavioural disorder

-

Genetic (cognitive) disorders associated with the RAS/ERK/mTOR pathway



Macrocephaly AND skin abnormalities in children with a developmental and behavioural disorder

- Neurofibromatosis

- Two or more of the following clinical features must be present:

  - Summary of NIH diagnostic clinical criteria for NF1

    the first step for us clinicians!

Erasmus MC

NF1: summary of general characteristics

- **NF1 is a multisystem disease and not rare !!**

- Incidence: approximately 1 in 3000 individuals

- - Mutations in the *NF1* gene, located at chromosome 17q11.2 -
- - many pathogenic mutations recognised
- - poor genotype- fenotype correlation

- Neurofibromin is the protein product encoded by the gene

- Neurofibromin is expressed in many tissues, including brain, kidney, spleen, and thymus, osteocytes

Erasmus MC

Clinical diagnostic criteria NF1

1. Six or more café au lait maculae

- - 0,5 cm diameter before puberty
- - 1,5 cm diameter after puberty

(often appear after 6 months of age)

Clinical diagnostic criteria NF1

2. Two or more cutaneous neurofibroma or one or more plexiform neurofibroma

Clinical diagnostic criteria NF1

2. Two or more cutaneous neurofibroma or one or more plexiform neurofibroma

Appear after puberty, not of help for diagnosis at young age !

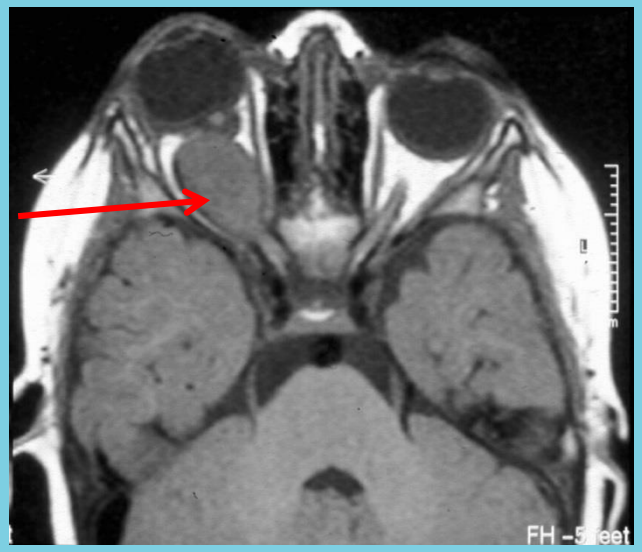
Erasmus MC

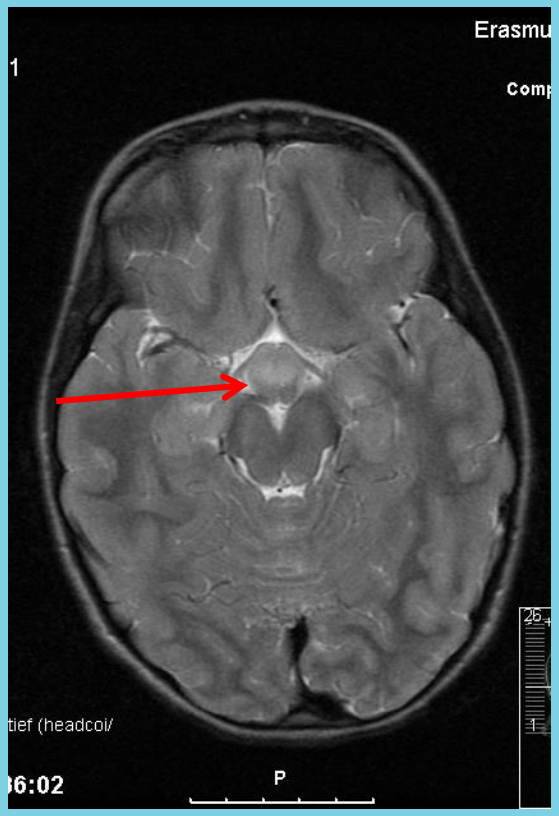
Clinical diagnostic Criteria NF1

3. Freckling in the axillary or inguinal
   (children often > 6 years)

4. Optic pathway glioma (20% of chldren with NF1)

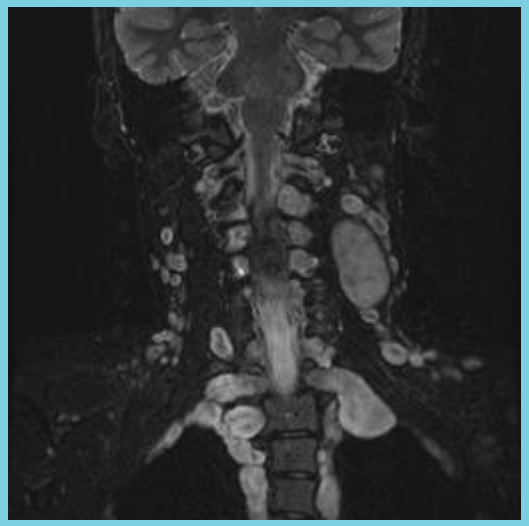
often asymptomatic

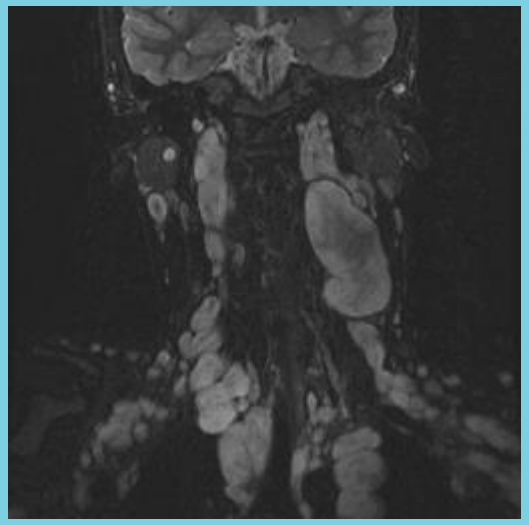


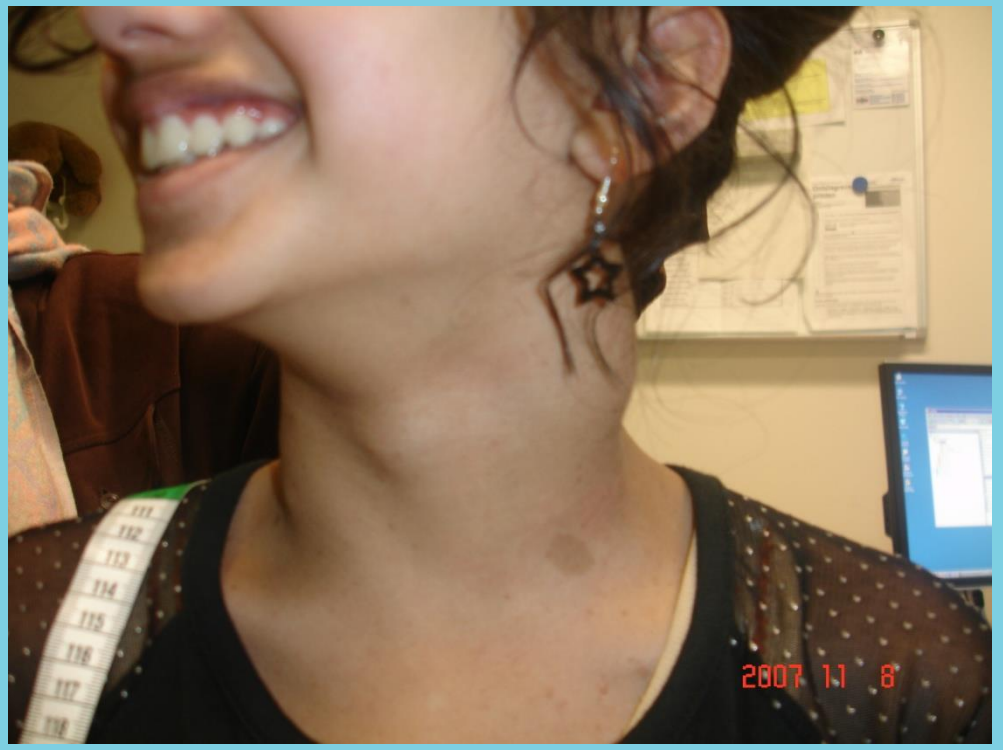


Erasmus MC

5. NF1: plexiform neurofibroma



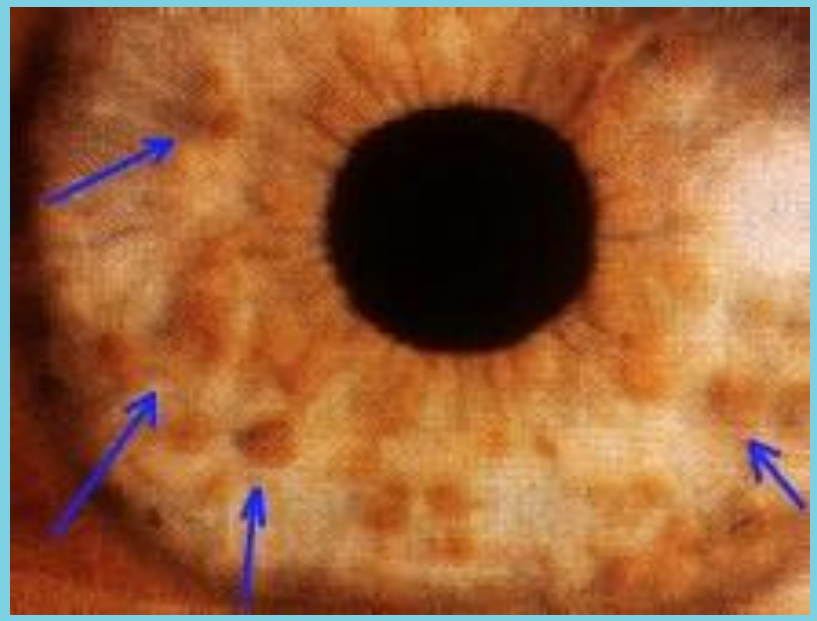




Erasmus MC

6. Two or more Lisch noduli

(iris hamartoma = mostly occur after age 10)



Erasmus MC

Clinical diagnostic criteria NF1

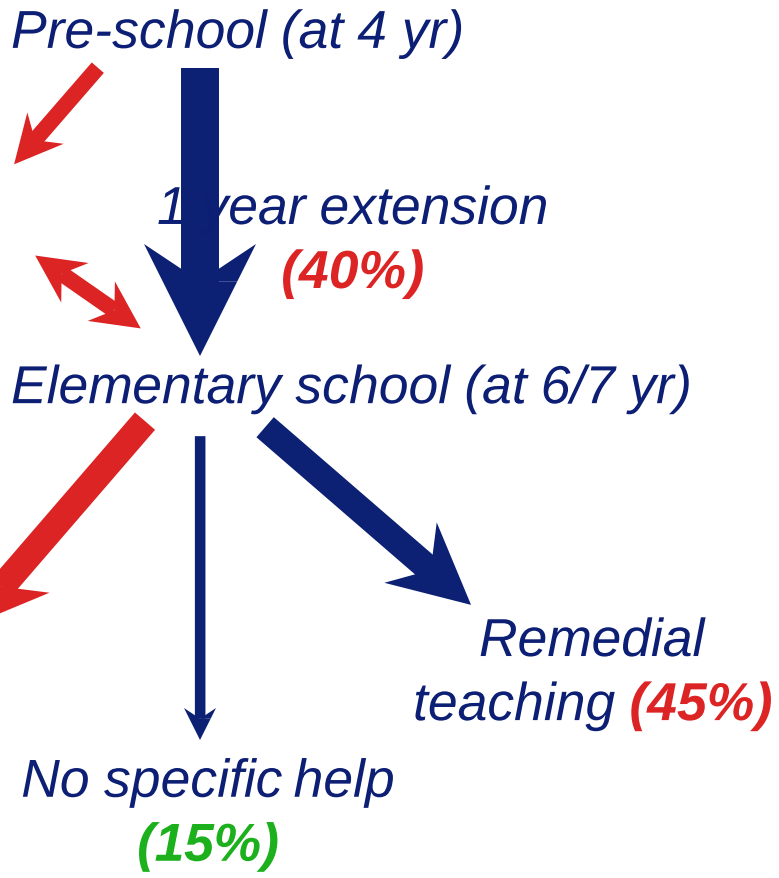
7. Skeleton dysplasia (dysplasia os sphenoidale or cortical thinning of long bones with or without pseudoarthrosis)

Erasmus MC

Clinical diagnostische criteria NF1

8. First grade family member with NF1

School performance of 86 Dutch NF1 children



Krab et al. J. Child Neurol. 2008; 23:1002-10

Most severe burden in children with NF1

- *Average 10-15 points lower IQ*
- *Visuospatial impairment*
- *Attention-deficit-hyper-activity disorder (up to 40%)*
- *Problems in executive functioning*
- *Fine and gross motor coordination deficits*

(Systematic review: Lehtonen et al., 2013)

- ***21-25% autism spectrum disorder***

(Garg et al., Pediatrics; Plasschaert et al., J Autism Dev Disord.)

Tuberous Sclerosis Complex

- Autosomal dominant, 67% new mutations (incidence 1:10.000)
- 100% penetrance, variable expression
- TSC1 gene: chromosome 9q34
    - Hamartine
- TSC2 gene: chromosome 16p13.3
    - Tuberine
- Hamartine-tuberine complex/ negative regulator of cel cycle

Adenoma sebaceum

Hypomelanotic maculae

Erasmus MC

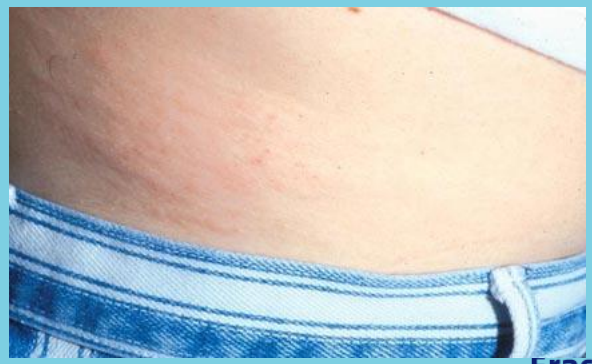
TSC: hypomelanotic maculae

Angiofibromata in TSC patients

Erasmus MC

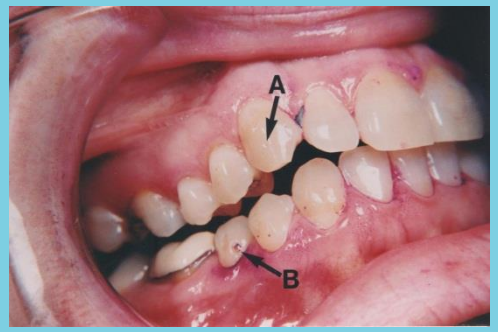
Othe cutaneous spotd in TSC

- Plaques
- Shagreen patch/ Peau de chagrin



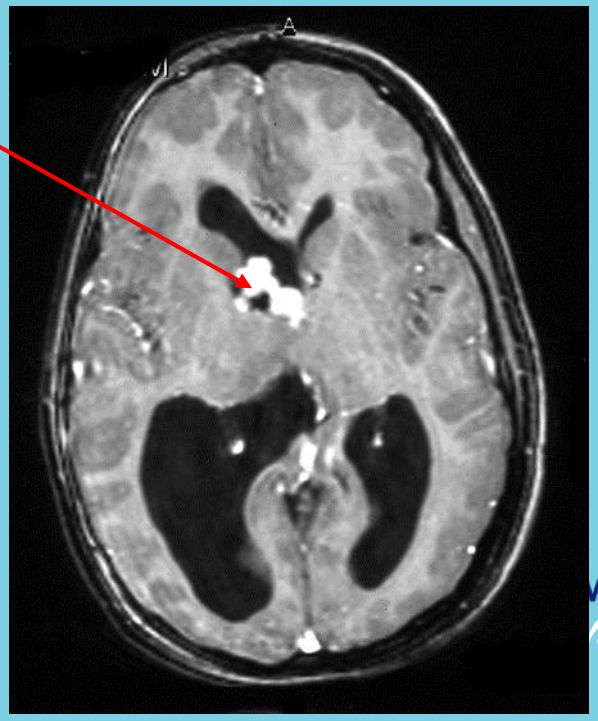
Erasmus MC

Abnormalities mouth and nails in TSC



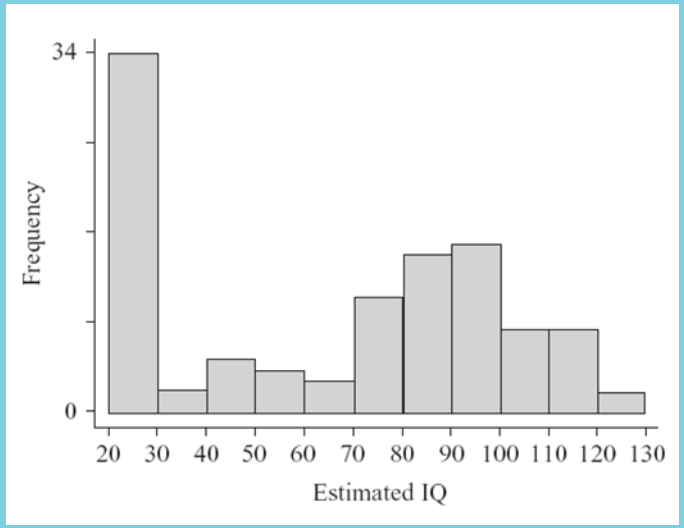
CZS pathology in TSC

- Cortical tubers (>80 %)
- Subependymal noduli (80%)
- Subependymal giant cell tumor (6-14%)
  - Benign/ 10-30 jaar



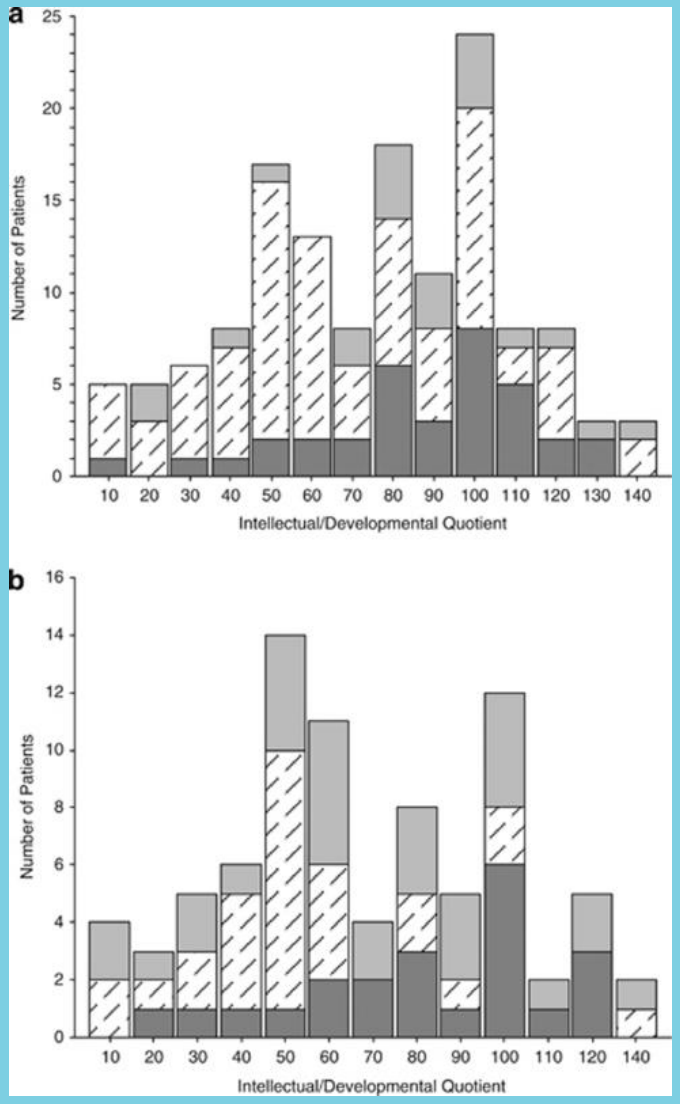
60% of TSC patienst have a cognitive impairment

- learning deficits
- ADHD
- autism



Erasmus MC

Cognitive restricitionion TSC1 and TSC 2



TSC1

TSC2

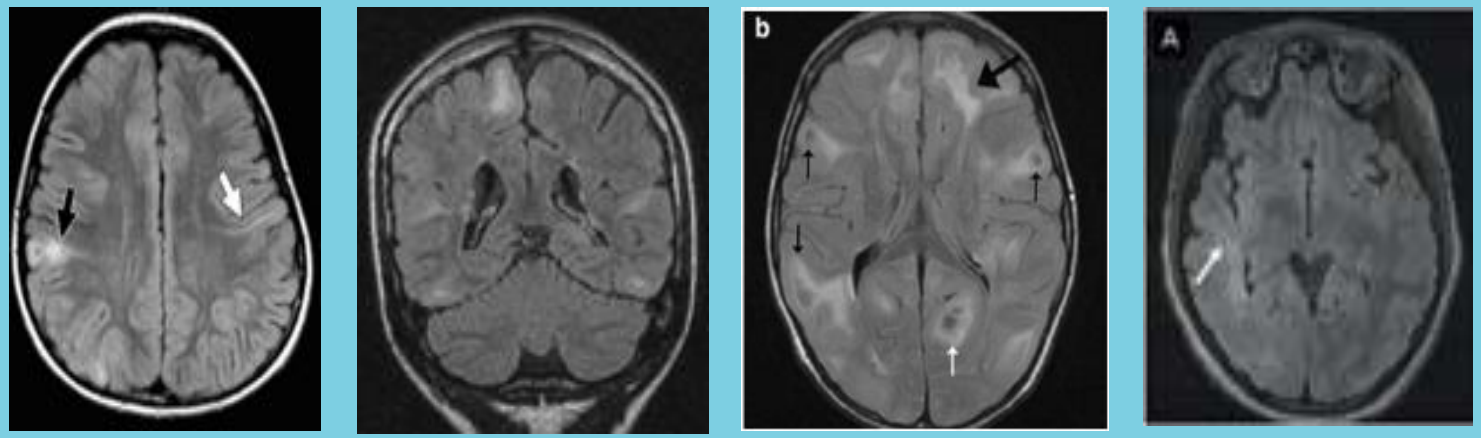
Van Eeghen et al. Eur J Hum Genetics

Erasmus MC

Severity of mental retardation in TSC dependent of

- Cerebral abnormalities
  - Number of tubers,
  - migration lines

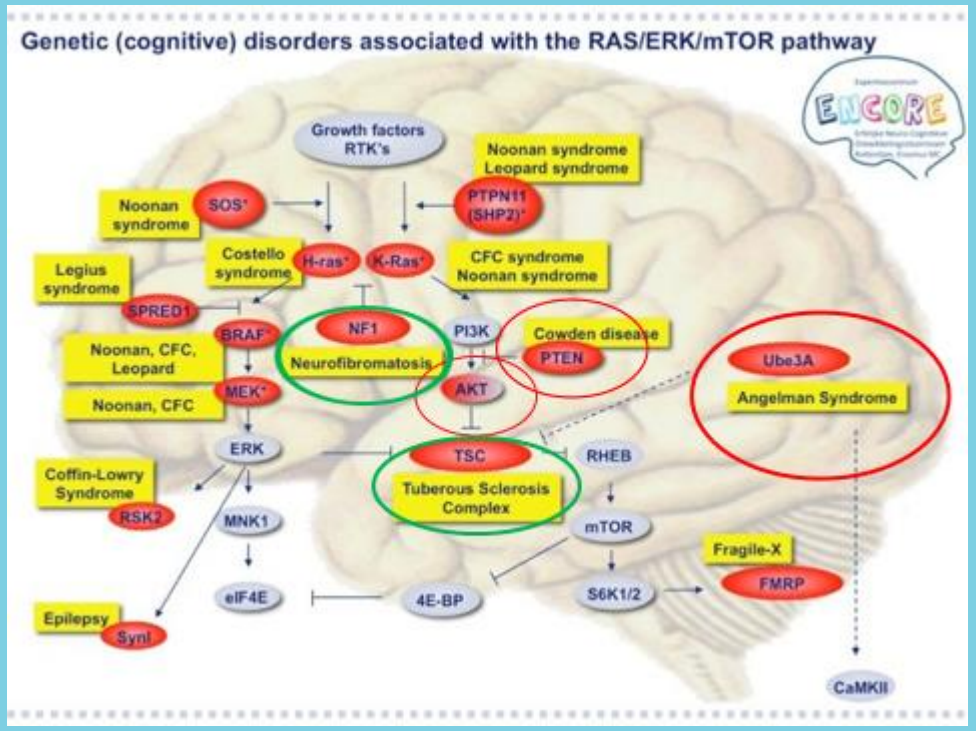
- Epilepsy (age at onset, seizure typem response to treatment)
-



Jansen Neurology 2008, van Eeghen J Ped Neurradiology 2013

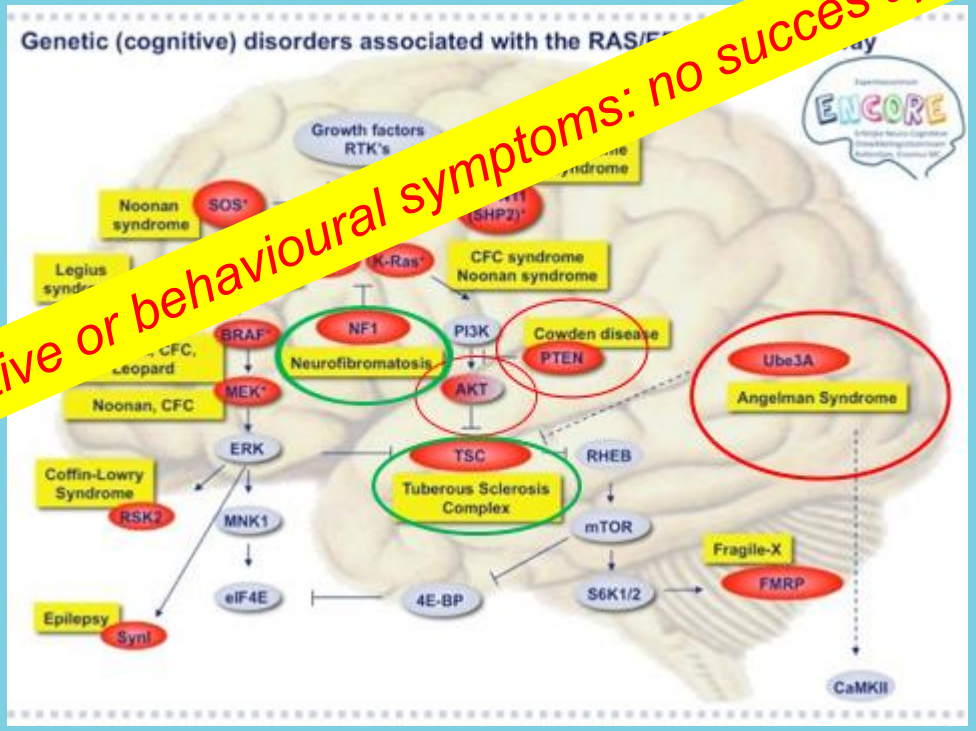
Erasmus MC

Knowledge of molecular pathways involved in genetic cognitive disorders leads to new treaments of the symptoms of these syndromes



Erasmus MC

Knowledge of molecular pathways involved in genetic cognitive disorders leads to new treatments of the symptoms of these syndromes



In respect to reversal of cognitive or behavioural symptoms: no succes up to now

Erasmus MC

Conclusion: clinical observation gives the most important clues to the cause of mental retardation

- Skull circumference and shape
- Skin abnormalities
- locomotion
- Behaviour
- Dysmorfic features
